NOTES ON THIS TECHNICAL INFORMATION

Validity
This Technical Information is valid for Australia and New Zealand.

Navigation
At the beginning of this document you can find a detailed content page which lists the individual chapters and their respective page numbers.

Definitions
- Supply lines or piping consist of pipes and their joints (e.g. compression sleeves, fittings, threads, or similar). This applies to gas piping, drinking water and heating piping and all other pipes in this Technical Information.
- Piping systems, installations, systems, etc. consist of the pipes and the necessary components.
- Connection components consist of fittings with the corresponding compression sleeves and pipes as well as seals and screw connections.

Illustration
Illustrations for individual subsystems are listed in the corresponding pipe, fitting and compression sleeve colours. Illustrations, which are applicable for system-wide applications, such as drinking water, heating, and gas installation or underfloor heating/cooling are illustrated with grey piping and white fittings/compression sleeves.

RAUTITAN gas system components
This Technical Information describes the components and requirements for the installation of RAUTITAN gas system using RAUTITAN ONE fittings and RAUTITAN PX polymer sleeves.

Components and assembly requirements for RAUTITAN gas system using RAUTITAN gas brass fittings and sleeves delivered as a SET are described in the respective sections of REHAU’s Technical Information “Piping, Connection and System Guidelines” (No. ANZ 872 0281.10.09) and “RAUTITAN GAS Installation System” (No. ANZ GT 0064.05.12 EN).
When installing this pipe system, please observe all applicable national and international regulations on installation, accident prevention and safety together with the information contained in this Manual.

Also observe the applicable laws, standards, guidelines and regulations (e.g. DIN, EN, ISO, NCC, BCA, PCS, NZBC, AS/NZS) as well as regulations on environmental protection, provisions of professional associations and regulations of the local public utility companies.

Any applications not described in this Manual - i.e. non-standard applications - must be discussed with our Technical Applications Department. For more detailed advice, please contact your REHAU Sales Office.

This design and installation information is related solely to the specific REHAU product. Occasionally, references are made to parts of applicable standards and directives. Always observe the current version of any guidelines, standards or directives.

Further standards, directives and guidelines related to the design, installation and operation of drinking water, heating or buildings services systems should also be referred to, but these do not form part of this Technical Information.

General safety measures
- Keep your workplace tidy and free of obstructions.
- Ensure there is always sufficient light.
- Keep children, pets and unauthorised persons away from tools and installation areas. This is especially important when carrying out refurbishment/repair work in occupied areas.
- Only use the corresponding components in the piping system that have been generally approved by REHAU. Using components which are not part of the system or tools which do not originate from the respective REHAU installation system can lead to accidents or other hazards.

Trades qualifications
- Only authorised and trained persons are allowed to install REHAU systems.
- Work on electrical systems and cables shall only be carried out by qualified, competent and authorised specialists.

Work clothing
- Wear eye protection, adequate work clothing, protective shoes, safety helmets, and a hairnet if you have long hair.
- Do not wear lose clothing or jewelry as these can be caught by moving parts.
- A safety helmet must be worn especially when carrying out installation work at face level or overhead.

Further standards, directives and guidelines related to the design, installation and operation of drinking water, heating or buildings services systems should also be referred to, but these do not form part of this Technical Information.

Follow the installation instructions
- Read carefully and observe at all times the Operating Manual for the REHAU installation tool which is being used.
- Incorrect handling of tools can cause cuts, crush or sever limbs.
- Incorrect handling of tools can damage jointing components and cause leaks.
- The REHAU pipe cutters have a sharp blade. Store and handle them in such a way that the REHAU pipe cutters will not create any risk of injury.
- When cutting the pipe to the desired length, keep a safe distance between the holding hand and the tool (pipe cutter).
- When cutting, do not reach into the cutting zone of the tool or near its moving parts.
- After the pipe expansion process, the expanded end of the pipe will return to its original shape (due to memory effect). During this time, do not put any other objects into the end of the expanded pipe, except for the intended REHAU fitting.
- Keep your hands away from movable parts or the tools pressing area during jointing.
- Before the joint is completed, the fitting may fall out of the pipe. This is an injury hazard.
- Always disconnect the power from a tool prior to carrying out maintenance work. This may include changing over any moveable parts (eg. compression jaws) or when moving the tool to a new location on site.

Operating parameters
- If the operating parameters are exceeded, the pipes and joints may become overstretched. Not adhering to the operating parameters is thus not allowable.
- Keeping within the operating parameters must be ensured by safety control equipment (e.g. pressure reducers, safety valves, etc.)
Gas piping: General safety measures
- Failure to observe the safety information/instructions may cause explo-
sions and fire and can result in fatal damage to persons.
- Always observe the requirements of the national gas standards, e.g. AS/
NZS 5601.1.
- Take extra care when designing and installing gas installations.
- Ensure through appropriate safety measures that there is no possibility
of uncontrolled gas leaks.
- Installation, modification and maintenance work on gas consumer piping
may only be carried out by the following persons:
  - gas utility person
  - gas fitters with a valid gas fitters license for the installation location
area.
- Always coordinate any work on gas installations with the responsible gas
provider prior to commencing the work.
- When working on gas consumer piping, escape routes must be kept
free at all times to ensure a quick and safe escape. Emergency exits are
to be kept clear.

Gas piping: What to do if there is a smell of gas in buildings
- Open all doors and windows to create a breeze path, avoid rooms which
smell of gas.
- Avoid any sparks or open flames / fires – if one is present extinguish it,
do not smoke and do not use any lighters.
- Do not operate any electrical switches, plugs, door bells, phones and
other communication devices in the building.
- Close the main lead and the isolating valve at the gas meter that lead
into the building.
- Warn other occupants of the building, but do not use the door bells and
leave the building.
- Contact the service centre of the gas provider/utility from a phone
outside the building.
- If you can hear leaking gas, leave the building immediately. Prevent
anyone else from entering the building. Call the police and fire brigade
from outside of the building!
- If the gas smell originates from a non-accessible room, contact the
police and fire brigade immediately from outside of the building!

Gas piping: What to do in case of fire
- Call the fire brigade.
- Do not extinguish burning gas, as unburnt gas can pose an explosion
risk.
- Close isolating valve at gas meter and/or main that leads into the build-
ing if it can be done without any danger.

Gas piping: Additional information
We recommend observing the following points, in addition to the safety
requirements and accident prevention measures which are in force in your
area:
- Do not smoke during work on gas installations and remove any other
potential ignition sources.
- Prior to starting the work, close the respective isolating valves and
secure them against unauthorised opening, e.g. by removing the handle
or key.
- Ensure all inlets and outlets of gas pipes are closed and gas-tight, e.g.
using end stops or plugs, if there is a possibility the isolating valve could
be opened unauthorised, intentionally or accidentally or if you have to
leave the workplace only for a short time.
- Ensure that all isolating valves are actually closed in a gas-tight manner.
- Once the pipe section you work on has been isolated correctly, the gas
inside the pipe has to be vented out. The venting out of the gas has to
de be done in a safe manner using hoses.
- Pipe sections that are out-of-order or no longer in use or disconnected
must be sealed permanently at their inlets and outlets in a gas-tight
manner, e.g. by using plugs stoppers, end caps or blank flanges.
- Immediately seal all openings resulting from the dismantling of gas
meters.
- Prior to cleaning the gas consumer piping, remove all gas appliances,
pressure regulators, gas meters and fixtures. Clean the pipes by blowing
out the pipes strictly to the outside of the building!
- If possible use gas detection devices for locating gas leaks. Never, under
any circumstances, use a naked flame to search for a gas leak.
- In case of using foaming chemicals to locate leaks, be aware that
hemp used for sealing joints can temporarily swell and prevent leakage
detection.
- Upon completing the pipework installation, always carry out a test for
gas leaks. For this test, the gas pipes must not be covered by anything.
All joints must be free from any coats and the gas pipes must not be
connected to any pipes carrying gas.
- Prior to putting the pipework back into operation, fill the pipes with the
intended operating gas and purge out the air inside the pipes until all the
air inside the pipes has been fully replaced by the gas. The exiting air/
gas mix has to be safely discharged to the outside of the building.
- Prior to putting the complete gas installation into operation, make sure
a pressure test is carried out successfully in accordance with rules and
regulations currently in force and a pressure test protocol is completed.
- When putting a gas system into operation and the system is charged
with gas, ensure all pipe openings are gas-tight.
### Component Overview

#### Pipe
- **Size 16 – 25**: Hot and cold water pipe RAUTITAN platinum  
- **Size 32 - 40**: Rainwater pipe RAUTITAN green  
- **Size 50 – 63**: Recycled water pipe RAUTITAN lilac

#### Compression sleeve
- RAUTITAN PX: PVDF  
- RAUTITAN MX: Brass

#### Fittings for water
- RAUTITAN PX: PPSU  
- RAUTITAN MX: Dezincification-resistant special brass

#### Universal fittings for water and gas
- RAUTITAN ONE: DZR Brass with yellow marking

#### RAUTOOLS
- Manual and battery operated compression tools, expanding tools and pipe cutters. Refer to Chapter 4.
3 PIPES AND FITTINGS

3.1 PE-X materials

- Corrosion resistance of the pipes: No pitting
- No tendency to deposits
- Polymer pipe material reduces sound transmission along the pipe
- Good resistance to abrasion
- All RAUTITAN pipes with WaterMark registration comply with AS/NZS 4020 (hygienic requirements)

Peroxide-crosslinked polyethylene
Peroxide-crosslinked polyethylene is designated PE-Xa. This method of crosslinking is conducted at high temperature and pressure with the aid of peroxides. Here, the individual molecules of the polyethylene combine to form a three-dimensional network. This high-pressure crosslinking is characterised by crosslinking in the melt away from the crystallite melting point. Crosslinking occurs during the moulding of the pipe in the tool. This method of crosslinking ensures an even and very high degree of crosslinking over the entire cross-section of even thick-walled pipes.

Inliner of RAUTITAN stabil and RAUTITAN gas stabil pipe
The interior pipe in RAUTITAN stabil and RAUTITAN gas stabil pipe, which comes into contact with the flowing medium, is known as inliner. This inliner is made of cross-linked polyethylene (PE-X).

Tab. 3-2 Technical data of pipes (approximate values)

---

⚠️ Pipes can be subjected to maximum operating temperature or maximum operating pressure and not both.

ℹ️ Single cases of blistering on the pipe surface of RAUTITAN stabil pipes may occur during operation. This blistering does not represent any reduction in quality or in usability and is not critical.

💰 RAUTITAN gas stabil pipe may only be used in consumer gas installation in accordance with AS/NZS 5601.1
3.3 RAUTITAN compression sleeves

Tab. 3-3 RAUTITAN compression sleeves

- Compression sleeve jointing technique with permanent sealing
- According to EN 806, DIN 1988 and DVGW worksheet W 534
- Approved for flush-mounted installation according to DIN 18380 (VOB)

3.4 RAUTITAN fittings

Fig. 3-5 RAUTITAN PX compression sleeve
Fig. 3-6 RAUTITAN MX compression sleeve
Fig. 3-7 Fittings RAUTITAN PX made of PPSU
Fig. 3-8 Fittings RAUTITAN MX (DZR brass) and RAUTITAN ONE (DZR brass with yellow marking)

- All fittings and compression sleeves RAUTITAN PX, RAUTITAN MX, and RAUTITAN ONE can be used for water services.
- RAUTITAN ONE fitting (with yellow marking) and RAUTITAN PX compression sleeves can be used for gas installations.
- Use RAUTITAN PX fittings only in combination with RAUTITAN PX compression sleeves.
- Do not combine fittings and compression sleeves from different ranges with each other.
- Please note the dimensions of the fittings and compression sleeves.
- You can find the range of connection components in the latest product book.

Fig. 3-6 RAUTITAN MX compression sleeve
Fig. 3-7 Fittings RAUTITAN PX made of PPSU
Fig. 3-8 Fittings RAUTITAN MX (DZR brass) and RAUTITAN ONE (DZR brass with yellow marking)

- Compression sleeve jointing technique with permanent sealing in accordance with EN 806, DIN 1988 and DVGW-worksheet W 534
- Robust jointing technique, highly suitable for construction site
- Without o-ring (self-sealing pipe material)
- Easy visual inspection
- Can be pressurised immediately
- Minimised pressure loss in fittings
- RAUTITAN MX and RAUTITAN ONE fittings are made of special dezincification-resistant brass according to AS 2345, EN 12164, EN 12165 and EN 12168

Material
- **RAUTITAN PX**: PPSU (Polyphenyl sulphone)

- **RAUTITAN MX**: Special dezincification-resistant brass according to AS 2345, EN 12164, EN 12165 and EN 12168 standards

- **Dezincification resistance**
  - Under the effects of certain types of drinking water, a particular form of corrosion known as dezincification can occur in standard brass alloys, e.g. free-cutting brass.
  - RAUTITAN MX fittings used in water services and heating installation are made of special dezincification-resistant brass and are tested for drinking water installation according to ISO 6509 and AS 2345. Fittings made of this special dezincification-resistant DZR brass have been proven in practice and have been in use for decades.

- **Erosion/Erosion corrosion**
  - Erosion is the pitting of materials beginning at the surface, caused by extreme velocities.
  - RAUTITAN pipes for water services and heating installation are expanded before jointing. The flow cross-section of the pipe is therefore adjusted to that of the fitting. This hydraulic and corrosion resistance advantage is optimised in RAUTITAN systems for water services and heating installation, in contrast to systems in which the pipes are not expanded at the joint.

- **RAUTITAN ONE**: Same material and properties as RAUTITAN MX, in addition marked with a yellow dot which are suitable for water and gas services.

Use RAUTITAN PX fittings only in combination with RAUTITAN PX compression sleeves.

**Fittings suitable for gas installation**

- Only use RAUTITAN ONE fittings in gas installation. These are made of DZR brass and identified with a yellow marking.
- Do not use any RAUTITAN PX or RAUTITAN MX fittings.
- The range of the connection components can be found in the latest product book.
Fittings suitable for RAUTITAN stabil pipe 16–32m

Don’t use RAUTITAN MX brass fittings without fully shaped pre-stop in combination with RAUTITAN stabil pipes. Since 1997, production at REHAU has been changed completely to incorporate fitting contours with pre-stop in sizes 16–32.

For detailed information about the compatibility of the fittings and compression sleeves with existing pipes, please contact your REHAU sales office.
RAUTOOL installation tools are specially designed and manufactured to work with REHAU programs.
- Manual and battery operated tools available
- Flexible and good tool handling
- No pipe calibration required

Before using tools, read and observe the information in the operating instructions completely.
- If these operating instructions are no longer present with the tool or are not longer available, order a copy or download them from the internet.
- Do not use damaged tools or partially functioning tools; send these for repair to your REHAU sales office.

Operating instructions can be downloaded online from www.rehau.com.au or www.rehau.co.nz.
4.1 Compression sleeve tools: RAUTOOL

- For RAUTITAN system
- For REHAU underfloor heating/cooling
- For special ranges, e.g. RAUTHERMEX for district heating
- Various attachment sets and accessories (see product book)

4.1.1 RAUTOOL M1

- Manual tool
- Sizes 16–40

Only use the compression jaws M1 with the RAUTOOL M1.

4.1.2 RAUTOOL A3

- Battery-operated hydraulic tool
- Sizes 16–40
- Drive with battery-operated hydraulic unit located directly at the tool cylinder
- The tool cylinder can be used optionally for hydraulic expansion.

4.1.3 RAUTOOL A-light2

- Battery-operated hydraulic tool
- Sizes 16–40
- Drive with battery-operated hydraulic unit located directly at the tool cylinder
- The tool cylinder can be used optionally for hydraulic expansion.

The RAUTOOL A2/A3/A-light/A-light2 are compatible with each other and can be equipped with the same supplementary sets.

4.1.4 RAUTOOL G2

- Tool for the pipe sizes 50–63 (optionally available for size 40 x 5.5)
- Drive with electro-hydraulic power unit (optionally with a foot pump)
- The tool cylinder can be used optionally for expansion and clamping.
4.2 Pipe cutters

When cutting RAUTITAN pipes, observe the following:
- Use the correct pipe cutters for the corresponding pipe type only.
- Cut the pipe square and without burrs.
- Pipe cutters must be in good working condition.

Spare blades for pipe cutters can be re-ordered (except for pipe cutter 25)

Tab. 4-1 Pipe cutters for RAUTITAN stabil and RAUTITAN gas stabil pipes

Tab. 4-2 Pipe cutters for RAUTITAN PE-Xa pipes
4.2.1 Pipe cutter 16/20 (stabil)

Fig. 4-5 Pipe cutter 16/20 (stabil) required for cutting RAUTITAN stabil pipe

For right-angled cutting and without burrs of RAUTITAN stabil pipe in sizes 16 and 20.

⚠️ Only use pipe cutter 16/20 (stabil) when cutting RAUTITAN stabil and RAUTITAN gas stabil pipe sizes 16 and 20.

ℹ️ PE-X pipes can also be cut with the pipe cutter 16/20 (stabil).

---

4.2.2 Pipe cutter 25

Fig. 4-7 Pipe cutter 25

To be used exclusively for burr-free cutting of PE-X pipes up to size 25 (see Tab. 4-1 and 4-2).

---

4.2.3 Pipe cutter 40

Fig. 4-8 Pipe cutter 40

To be used exclusively for burr-free cutting of PE-X-pipes up to size 40 and for RAUTITAN stabil/RAUTITAN gas stabil in size 25 to size 40 (see Tab. 4-1 and 4-2).

---

4.2.4 Pipe cutter 63

Fig. 4-9 Pipe cutter 63

To be used exclusively for burr-free cutting of RAUTITAN pipes or PE-X-pipes sizes 40–63 (see Tab. 4-1 and 4-2).
4.3 Expanding tools

4.3.1 Expander heads and expander bits for pipes

Take care when using expander tools:
- Use only undamaged tools in good working condition
- Make sure the correct expander head is used with its respective pipe type
- Keep the sleeve outside the expansion area to avoid damage to the pipe or the expansion segments
- Don’t drop expander heads as segments may bend or break
- Avoid rust and corrosion. Keep heads and tools dry and regularly lubricate the expander tool cone with REHAU lubricant included in the tool case. Worn or corroded expander heads shall be replaced.

4.3.2 Expander heads QC

The Expander heads QC (Quick Change) include a quarter-turn locking mechanism for easy tool change. They adapt to the Expander tool QC (in black colour). The Expander tool QC can accommodate both, the Expander heads QC as well as Expander heads RO with screw connection.

4.3.3 Expander set 16/20

The expander set 16/20 can be used in combination with RAUTOOL A2/A3/A-light/A-light2 to expand RAUTITAN platinum, RAUTITAN red, RAUTITAN pink, RAUTITAN green, RAUTITAN lilac and RAUTHERM S 16 x 2.0 mm.

Differences between expander heads

Expander head for RAUTITAN stabil and RAUTITAN gas stabil pipes
- Green colour code
- Black retaining nuts for sizes 16–32
- Expansion segments with tapered ends

Expander head for RAUTITAN platinum, RAUTITAN red, RAUTITAN green, RAUTITAN lilac and RAUTHERM S 16 x 2.0 mm
- Blue colour code
- Silver retaining nut for sizes 16-32
- Expansion segments are not tapered

4.3.4 Expander bits

The following expander bits can be used in combination with RAUTOOL A2, A3, A-light and A-light2:
- Universal expander bit 25/32 system RO
- Expander bit 40 x 6.0 stabil (for RAUTITAN stabil and RAUTITAN gas stabil pipes)
- Expander bit 40 x 5.5 (for RAUTITAN PE-Xa pipes)

RAUTITAN stabil and RAUTITAN gas stabil pipes size 40 can only be expanded using the expander bit 40x6.0 (green) in combination with RAUTOOL A2, A3, A-light or A-light2. Expansion is not possible with RAUTOOL G1/G2 and M1.
### Tab. 4-3 Expander heads for RAUTITAN stabil and RAUTITAN gas stabil pipes

</tr>
</tbody>
</table>

**Tab. 4-5** Compression jaws for RAUTITAN PX compression sleeves, size 40

RAUTITAN PX compression sleeve in size 40 need to be compressed with the black compression jaws size 40.

Previous compression jaws (gold-yellow) of other sizes, e.g. 16, 20, 25, 32, 50 and 63, can still be used without restriction.

- Only compress RAUTITAN PX compression sleeves, size 40, with the RAUTOOL compression jaws (black) size 40.
- Only make compression sleeve joints with RAUTOOL tools. If other tools are to be used when making the joint, these must be approved by the corresponding manufacturer for use with RAUTITAN system and especially for use with RAUTITAN PX fittings and compression sleeves.
TRANSPORT AND STORAGE

Avoid damaging the pipes and system components:
- Load and unload with due care.
- Only transport in a fashion suitable for the material.
- Do not drag over floors or concrete surfaces.
- Store on a flat surface with no sharp edges.
- Protect against mechanical damage.
- Protect against dirt, drilling dust, mortar, grease, oil, paint, solvents, chemicals, humidity, etc.
- Protect against sunlight, e.g. with an opaque film or similar material.
- Protect against long sunlight exposure during the construction phase.
- Only unpack shortly before laying.
- For hygiene reasons, cap or seal open pipe ends and protect pipes and fittings from contact with harmful substances.

Protect pipes and fittings against UV radiation during storage and transportation. When laying in areas where UV-radiation (e.g. sunlight, neon light) can occur, cover the piping fully with UV-proof material.

---

Fig. 5-1 Protect pipes against sunlight

Fig. 5-2 Do not store pipes on sharp-edged surfaces
Universal REHAU compression sleeve jointing technology
- Permanently sealed joint
- Without O-ring (self sealing pipe material)
- Easy visual inspection
- Can be immediately pressurised
- Pipe doesn’t need to be calibrated or deburred
- Robust jointing technology, highly suitable for construction sites

The REHAU compression sleeve jointing technology for sizes 16-32 mm is described below. Directions for tool handling and making the joint in other pipe sizes are described in the respective operating instructions.

Operating instructions can be downloaded from www.rehau.com.au or www.rehau.co.nz.

Installation temperature
- Minimum installation temperature is −10 °C.
- Maximum installation temperature is +50 °C.

6.1 Jointing procedure

6.1.1 Cutting the pipe

Fig. 6-1 Cut the pipe at 90° and without burrs

1. Select the appropriate pipe cutter (refer to Tab 4-1 and 4-2).
2. Cut the pipe at 90° and without burrs.

- Only make compression sleeve joints with RAUTOOL. If foreign tools are to be used when making the joint, these must be approved by the corresponding manufacturer for use with RAUTITAN system and especially for use with RAUTITAN PX fittings and compression sleeves.
- Only make the joint with the appropriate installation tools.
- Please observe the Technical Information and the corresponding operating instructions and instruction leaflets for information on handling the tools and making joints.
- Do not use dirty or damaged connection components or tools.
- The battery and mains operated tools such as A-light 2, A3, G2 are not suitable for permanent operation. After approx. 50 consecutive clamping operations, a break of at least 15 min. is required to allow the tool to cool down.
- The range of connection components can be found in the latest product book.

- Check the blade of the pipe cutters regularly for damage and replace the blade or the cutters as necessary. Damaged or blunt blades can cause burrs or notches on the pipes, which can tear when the pipe is expanded.
- If the pipe was cut improperly, re-cut the pipe to ensure a square and burr-free cut.
- If cracks at the expanded zone, cut off the damaged pipe end and repeat the expansion procedure.
1. Ensure the pipe end (at least three times the compression sleeve length) is straight and free from any foreign material (e.g. lubricant, adhesive or tape).

2. Slide the compression sleeve onto the pipe:
   - RAUTITAN PX compression sleeve can be compressed towards the fitting from both ends, the orientation does not matter.
   - Brass compression sleeve shall be compressed with the chamfered side facing the fitting.

3. Maintain a minimum distance between the pipe end and the compression sleeve of at least twice the compression sleeve length.
6.1.3 Expanding the pipe

1. Select the appropriate expander head, refer to Tab 4-4 and 4-5.
2. Screw the expander heads fully onto the expansion tool.
3. Always insert the segments of the expander head completely into the pipe. Avoid skewing the expander head. Expand the pipe once.
4. Rotate the expander tool by 30° while the pipe remains in position. Expand the pipe once again.

The pipe must have an even temperature before expansion. Avoid local heating (e.g. by inspection lights, etc.).

- Avoid using damaged or dirty expander heads, pipes or connection components.
- Use only non-defective expander heads (e.g. not bent, broken off, fractured). Replace defective expander head.
- Maintain a minimum distance between the pipe end and the compression sleeve (at least twice the length of the compression sleeve).
- Ensure expander head does not detach during rotation.
- Always check the expansion evenness of the inner surface of the expanded pipe end (e.g. no grooves, no local overstretching of the pipe material).
- If cracks or overstretching occurs, discard pipe end and repeat.
- Regularly check expander heads for freedom of movement and dirt, clean if necessary.
- Apply REHAU grease to the cone of the expander tool only and not to the expansion segments.

Fig. 6-7 Rotate the expander tool 30° at the same pipe position and expand the pipe once again.

Fig. 6-8 Damage to the pipe material due to defective expander tool
### 6.1.4 Inserting the fitting into the expanded pipe

**Fig. 6-9** Insert the fitting into the expanded pipe

1. Immediately after expansion, completely insert the fitting into the expanded pipe. Pipe contracts with time due to memory effect.
2. Ensure all sealing ribs are covered by the pipe.
   - **Exception:** The last sealing rib is not covered for RAUTITAN PX fittings size 40 in conjunction with RAUTITAN stabil pipe.
3. Ensure joints do not move apart before compression is finished.

**Important:** Only insert REHAU fittings into the expanded pipe end.

### 6.1.5 Compressing the joint

**Fig. 6-10** Place the fitting and compression sleeve in between the jaws.

1. Place the compression sleeve joint onto the compression tool at 90°.
2. Push the compression sleeve fully up to the fitting collar.
3. Visually inspect the joint for damages and incomplete compression.

Keep the tool clean and lubricated and store in a cool dry place.

**Bulging of brass compression sleeves may occur (e.g. when using older expander heads with RAUTITAN PE-Xa pipes) but does not impair the quality of the joint. To avoid bulging, stop compressing approx. 2 mm from the fitting collar. This does not apply to RAUTITAN stabil and RAUTITAN gas stabil pipes.**

**Important:**
- Perform jointing only on a straight pipe section (not on pipe bend).
- The straight pipe section must be at least three-times the compression sleeve length.
- Avoid skewing of the tool jaw onto the pipe while maintaining full contact of the tool jaws with the fitting barb and compression sleeve.
- Avoid using lubricants, water, etc. when making the compression sleeve joint.
7 INSTALLATION GUIDELINES - WATER AND GAS

For detailed information on planning, installation and operation of REHAU systems for underfloor heating/cooling with heating pipes RAUTHERM S AND RAUTITAN pink, refer to Technical Information “Underfloor heating/cooling”.

7.1 General

- Do not use dirty or damaged system components, pipes, fittings, compression sleeves or seals.
- Make sure that the connection components are free of inadmissible stress during assembly and when in operation. Make sure that the piping has sufficient scope of movement (e.g. from deflection legs).
- When flat-sealed joints (or similar) are opened, check that the sealing surface is undamaged before reconnecting and insert a new seal if necessary.

Installation temperature
- Minimum installation temperature is -10°C
- Maximum installation temperature is +50°C

7.2 Protection against corrosion and damage

- Use suitable sheeting to protect fittings and compression sleeves against contact with brickwork or with screed, cement, plaster, bonding agents, aggressive media and other materials and substances which can cause corrosion.
- Protect fittings, pipes and compression sleeves against humidity.
- Protect fittings, pipes and compression sleeves against dirt, drilling dust, primer and glue, mortar, grease, oil, paint, lacquers, adhesive/protective primers, solvents, etc.
- In aggressive environments (e.g. farming, encased in concrete, sea water atmosphere, cleaning agents), protect piping and fittings against corrosion adequately and in such a way that they are sealed against vapours (e.g. to aggressive gases, fermentation gases, chloride mediums).
- Ensure that the employed sealants, cleaning agents, building foams, insulation, protective tape, adhesive tape or thread sealant etc. do not contain any components which cause stress cracking or corrosion, e.g. ammonia, ammonia-bearing, aromatic and oxygenated solvents (e.g. ketone and ether), chlorinated hydrocarbons or chloride ions which can leach.
- Protect systems against contact to chemicals and damage (e.g. during the construction phase, when in the area of vehicles, machines or farming, and from damage caused by animals).
RAUTITAN PX
- Only use leak detection agents (e.g. foaming agents) approved by the respective manufacturer for PPSU and PVDF materials
- Only use sealants, thread sealants, cleaning agents, building foams, insulation, protective tape, adhesive tape and flux, which were approved by the respective manufacturer for the materials PPSU and PVDF.
- Check the compatibility of materials for the corresponding area of application.
- Contact with aromatic and oxygenated solvents (e.g. ketone and ether) as well as halogenated hydrocarbons (e.g. chlorinated hydrocarbons) is not permitted.
- Contact with water-based acrylic paints and adhesive/protective primers is not permitted.

Water additives
Inhibitors, antifreeze agents or other heating water additives may damage the system. Check suitability with respective manufacturers and REHAU’s Application Department.
7.3 Pipe support and fixing

7.3.1 Pipe brackets and clips

Use only pipe brackets and clips with the following properties:
- Suitable for plastic pipes
- Improved acoustic properties through rubber lining
- Correct size (to allow easy gliding of pipe without pulling the rubber lining out)
- Free of burrs

Tab. 7-1 Guideline values for fixing parameters of anchor points

7.3.2 Anchor points

- Anchor points can be used to restrict the thermal linear expansion into one direction.
- Long pipe run can be divided into several sections by adding several anchor points.
- Anchor points can be fixed at tees, elbows or connectors. Anchor points can be fixed by installing a pipe bracket directly before each compression sleeve of the fitting

Fig. 7-5 Anchor point made by pipe clamps

Pipe brackets shall not be installed on compression sleeves.

7.3.3 Spacing between brackets and clips

Choose the correct pipe spacing intervals according to the guideline values (see Table 7-2 and 7-3) for installation with or without pipe support channels.

7.3.4 Exposed installation

When installing pipe at exposed areas or installing long piping without change in direction, we recommend using pipe support channel for RAUTITAN PE-Xa pipes.
- For installation without pipe support channel, install anchor points at 6 m intervals.
- Ensure that there is sufficient space for piping to expand.

For installation of RAUTITAN PE-Xa pipes without pipe support channel, pipe sagging is to be anticipated.

</tbody>
</table>

Tab. 7-3  Recommended spacings of pipe bracket/clip for metal composite pipes
7.4 Pipe support channel

7.4.1 Benefits of using pipe support channel

- Reduces thermal expansion length
- Clip effect increases the axial retaining force
- Stabilizes the pipes against sagging and sideways bending
- Increases rigidity
- Increases the pipe clamp interval to 2 m regardless of the pipe size
- Visually appealing installations in exposed areas with RAUTITAN PE-Xa pipes
- Simple assembly
- Self-supporting
- Clipped onto the pipe

7.4.2 Functionality

The pipe support channel covers the pipe by about 60% and is shaped to closely encase the pipe without additional fastenings. This strong clamping effect prevents the pipe from bending and reduces thermal expansion in length.

Fig. 7-6 Cross-section of pipe support channel

7.4.3 Assembly of the pipe support channel

Do not fit pipe support channel or pipe fasteners close to the deflection legs so the pipe can still bend.

Pipe cover

Fig. 7-7 Let the pipe support channel end approx. 2 mm before compression sleeve

The pipe support channel must be fitted over the entire length of the piping up to 2 mm before the compression sleeve, as only this ensures reduction of the thermal expansion length.

Pipe clamp intervals

Fig. 7-8 Maximum pipe clamp intervals

The maximum pipe clamp interval when using the pipe support channel is 2m for all sizes. The distance from the pipe end, or when changing direction, to the first pipe fastener may not exceed 0.5 m. This way, pipe brackets for pipe routing or in cellars can be attached in a uniform and effective manner.
**Fitting cover**

Fittings with brass compression sleeve sizes 50 and 63 can be clipped by the pipe support channel if the pipe support channel projects at least 0.5 m beyond the compression sleeve. With this kind of installation, cutting off the pipe support channel at the fitting is not necessary.

Clipping over the fitting is not possible when using RAUTITAN PX compression sleeves.

---

**Assembly of the pipe support channels**

Reduced retaining force of the pipe support channel can cause greater thermal expansion of the pipe.

Do not lessen the retaining force of the pipe support channels by storing or assembling them improperly.

1. Cut off the pipe support channel with a metal saw (see Fig. 7-11). Maintain a safe distance between your holding hand and the cutting tool. Saw pipe support channels from the rounded rear side, not the open side so that they are not bent open at their bordered ends.

2. If the pipe support channel has been bent inwards or outwards when it was cut to length, bend the pipe support channel back to its original shape.

3. Deburr the ends of the pipe support channel.

4. Clip the pipe support channel onto the pipe (by hand or using a pliers or pipe wrench with plastic jaws). Do not overlap the ends of pipe support channels.

5. To join support channels together, use cut-offs clipped over both ends.

Even short cut-offs of the pipe support channel can be used for clipping over joints, ensuring an almost waste-free installation.
7.5 Pipe bending

RAUTITAN stabil and RAUTITAN gas stabil pipe can be bent either by hand or by using a bending tool. *

Minimum bending radius
- When bending without tools, the minimum bending radius is five times the pipe diameter.
- When bending with a spiral spring, the minimum bending radius is three times the pipe diameter.
- The minimum bending radius is measured with respect to the centre of the pipe.
- After bending, ensure that there are no kinks, wrinkles or bulges and that the outer PE sheath and aluminium layer are undamaged.

Only cold bending of pipes RAUTITAN stabil and RAUTITAN gas stabil is allowed.

* For approved bending tools for RAUTITAN stabil and gas stabil pipes contact your local REHAU sales office.
7.6 Provision for thermal expansion

7.6.1 Calculating thermal length changes

The thermal change in length is calculated with the following equation:

$$\Delta L = \alpha \cdot L \cdot \Delta T$$

$\Delta L = $ Length change in mm
$\alpha = $ Coefficient of linear thermal expansion in $\text{mm/m°C}$
$L = $ Length of piping in m
$\Delta T = $ Temperature difference in °C

The coefficient of linear thermal expansion must be selected according to the installed pipe type and if pipe support channel is installed.

Determining the pipe length

The pipe length $L$ is the actual installed pipe length on site between anchor points, expansion bends or loops. Sometimes it may be necessary to divide the pipe run into several sections by adding anchor points or expansion bends and loops to limit the change in length per section.

Determining the temperature difference $\Delta T$

To determine the temperature difference $\Delta T$, the following shall be taken into consideration:
- Installation temperature or minimum operating temperature (e.g. when the system is out of service)
- Maximum operating temperature (e.g. thermal disinfection)

Tab. 7-6 Coefficient of linear thermal expansion (approximate values) and material constants for deflection leg calculation (approximate values)
7.6.2 **Deflection legs**

Thermal length changes can be accommodated by deflection legs. RAUTITAN PE-Xa pipes are particularly suitable for this due to their flexibility.

A deflection leg is the freely moveable pipe length, which can take up the required thermal length changes. The length of the deflection leg is influenced mainly by the material (material constant C).

Deflection legs result mostly from changes in direction of the piping. For long piping lengths, additional deflection legs must be installed in the piping to compensate the thermal length changes.

---

**Fig. 7-17** Deflection legs

</tr>
</tbody>
</table>
7.6.3 Calculation of deflection leg length

The minimum length of deflection length (DL) is calculated by the following formula:

\[ L_{DL} = C \cdot \sqrt{d_a \cdot \Delta L} \]

- \( L_{DL} \) = Length of deflection leg
- \( d_a \) = Outer pipe diameter in mm
- \( \Delta L \) = Length change in mm
- \( C \) = Material constant of piping material

For approximate values for material constant \( C \), see Table 7-6.

Do not fit pipe support channels or pipe brackets close to the deflection legs so it will not be prevented from bending.

Fig. 7-18 U expansion bends.

![U expansion bends diagram]

\( L_{ DL } \)
\( \frac{1}{2} L \)
\( L \)
\( +\Delta L/2 \)
\( -\Delta L/2 \)
\( F \)
\( G \)

Fixed/anchor point (tight)
Gliding point (loose)

7.6.4 Calculation examples

The pipe length \( L \), for which the thermal length change is to be accommodated at a deflection length, is 7 m.

The temperature difference between the minimum and maximum values (installation temperature and subsequent operating temperature) is 50 °C. The installed pipe outer diameter is 25 mm.

What length of deflection leg is required according to the installed pipe type?

**Calculation of deflection leg length with RAUTITAN stabil and RAUTITAN gas stabil**

\[ \Delta L = a \cdot L \cdot \Delta T \]
\[ \Delta L = 0.026 \cdot \frac{mm}{m \cdot °C} \cdot 7m \cdot 50°C \]
\[ \Delta L = 9.1 mm \]

\[ L_{ DL } = \frac{C \cdot \sqrt{d_a \cdot \Delta L}}{2} \]
\[ L_{ DL } = \frac{33 \cdot \sqrt{25mm \cdot 9.1mm}}{2} \]
\[ L_{ DL } = 498 mm \]

**Calculation of deflection leg length with RAUTITAN PE-Xa pipes installed with REhAU support channel**

\[ \Delta L = a \cdot L \cdot \Delta T \]
\[ \Delta L = 0.04 \cdot \frac{mm}{m \cdot °C} \cdot 7m \cdot 50°C \]
\[ \Delta L = 14 mm \]

\[ L_{ DL } = \frac{C \cdot \sqrt{d_a \cdot \Delta L}}{2} \]
\[ L_{ DL } = \frac{12 \cdot \sqrt{25mm \cdot 14mm}}{2} \]
\[ L_{ DL } = 224 mm \]

**Assessment of the results**

RAUTITAN stabil and RAUTITAN gas stabil have lower thermal change length than RAUTITAN PE-Xa pipes due to its aluminium layer. However, the required deflection leg length for RAUTITAN PE-Xa is shorter due to the flexible pipe material.

For metallic pipe materials, a substantially larger deflection leg is required for the same operating parameters during installation, due to the significantly higher material constant (C), than for other RAUTITAN pipes system.
7.7 Installing threaded fittings

General installation requirements
- Avoid over-tightening threaded joints.
- Only use sealants approved for gas and water installation.
- Do not apply excessive hemp to threaded joints. The thread tips must be visible.
- Use open-end wrenches in the right size. Do not clamp fitting too tightly into the vice.
- Pipe wrenches may cause damage to the fittings and compression sleeves.
- Do not extend the leverage of installation tools, e.g. with pipes.

Compatibility of different thread types
- Only the following thread types may be used with RAUTITAN system:
  - Rp = cylindrical female thread
  - R = tapered male thread
  - Fastening pipe threads in accordance with ISO 228 (AS 1722.2):
  - G = cylindrical thread, non-sealing in thread
  - Check compatibility of different thread types before screwing them together, e.g. tolerances, free movement.
  - Only use an appropriate G male connector with flat sealing thread fittings with G female thread.
  - If using long threads, ensure the maximum possible screwing depth and sufficient thread depth in opposing parts with inside threads.

7.8 Transition to other pipe materials

Gas piping
- Only use RAUTITAN ONE threaded adapters for the transition to other pipe materials.
- A direct transition to stainless steel installation system is not permitted. Use a non-stainless steel interim piece for the connection of both systems, e.g. a combination of: RAUTITAN ONE threaded adapter with male thread – threaded socket – threaded adapter with male thread made of stainless steel.
- Only use mating threads according to AS 1722.1, ISO 7-1 and EN 10226-1 (Rp/R).

Water piping
- A direct transition to stainless steel installation system is not permitted. Use a non-stainless steel interim piece for the connection of both system, e.g. a combination of: RAUTITAN MX or RAUTITAN ONE threaded adapter with male thread - threaded socket - threaded adapter with male thread made of stainless steel. A transition piece made of gunmetal between both fittings is recommended.
- Only use mating threads according to AS 1722.1, ISO 7-1 and EN 10226-1 (Rp/R).

Brazing connections
- Brazing joints shall be made before connecting to RAUTITAN system.
- After brazing the fitting must completely cool down before making the compression sleeve joint.

If repair works or piping network extensions include a change from an existing system to RAUTITAN system (or vice versa), threaded joints or connection barbs must be used as clear division between the different systems and to maintain warranty.
7.8.1 Transition to copper system

For transitions from RAUTITAN system to brazed systems, use RAUTITAN connection barbs. After brazing the fitting must completely cool down before making the connection to RAUTITAN system.

Fig. 7-21 RAUTITAN connection barb brazed to copper pipe

7.8.2 Transition to stainless steel system

There is a great difference in strength between stainless steel and dezincification-resistant brass.

- Direct transition between RAUTITAN system and stainless steel installation systems may cause leaks or damage to fittings
- Only connect RAUTITAN system to other systems made of stainless steel by interconnecting fittings (e.g. flush-mounted valves or water meters).

Fig. 7-22 Installation situation of a system adapter to a flush mounted valve (example)

1 Stainless steel system with flush-mounted valve  2 RAUTITAN system with RAUTITAN MX or RAUTITAN ONE adapters (brass)

Fig. 7-23 No direct transition from stainless steel system to RAUTITAN system up to size 32 or with threads up to R1/Rp1

1 Stainless steel system  2 RAUTITAN system with RAUTITAN MX adapters (brass)
7.9 Reusing jointing components

7.9.1 Reusable components

<table>
<thead>
<tr>
<th>Reusable</th>
<th>Not reusable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fittings RAUTITAN MX</td>
<td>Dispose of together with all cut-out pipe parts</td>
</tr>
<tr>
<td>Compression sleeves</td>
<td>Fittings RAUTITAN PX</td>
</tr>
<tr>
<td>Fittings RAUTITAN ONE</td>
<td></td>
</tr>
</tbody>
</table>

Tab. 7-7 Reusable jointing components

**RAUTITAN ONE:**
- RAUTITAN ONE components shall not be reused or detached and must be disposed.

**RAUTITAN PX and MX:**
- Dispose used RAUTITAN PX fittings and RAUTITAN PX compression sleeves.
- Only reuse RAUTITAN MX fittings in perfect condition within the same application type from which they were removed from.
- Removed metal fittings from water installations shall not be used in gas installations, even when the fitting has a yellow marking.
- Dispose detached compression sleeves with the detached pipe sections

Do not cut RAUTITAN PX polymer sleeves to reuse MX brass fittings:
- The barb surface may accidently get damaged. A damaged barb surface may lead to leaks.
- An undisposed cut sleeve may accidently be reused. Using a cut sleeve may lead to leaks.

![Unapproved cutting of the PX sleeve](image-url)
7.9.2 Reusing RAUTITAN MX fittings

REHAU will not accept liability if these instructions are not followed (e.g. when heating up the compression sleeve joint when attached).

**Step 1: Cutting out the joint**
Cut the joint to be detached completely from the existing piping using a pipe cutter.

**Step 2: Heating the joint to be detached**
1. Heat up the cut-out RAUTITAN MX fitting and sleeves with a heat gun.
2. When reaching a temperature of approx. 135 °C remove the sleeve from the fitting body (e.g. with pliers).

Heating up the RAUTITAN PX compression sleeve to over 200 °C or direct flame exposure can lead to a build-up of toxic gases.
- Do not heat RAUTITAN PX compression sleeve to over 200 °C.
- It is not permitted to burn or apply a flame to RAUTITAN PX compression sleeves.

**Step 3: Removing the compression sleeves**
1. Remove sleeves and pipe sections from the fitting body.
2. Clean dirt from fitting.
   - When in perfect condition and cooled, RAUTITAN MX fittings can be reused in the same application.
   - Do not reuse detached compression sleeves and pipe sections.

**Step 4: Dispose used sleeves and pipe sections**

When the joint to be detached is heated, all joints of the heated fitting are no longer sealed.

Always separate the fitting to be heated completely from the piping!

---

**Planning and Installation (Water & Gas)**
7.10 Installation within concrete/screed floors and walls

Installation of RAUTITAN systems within concrete/screed floors and walls are allowed, provided specific requirements from local installation standards are fulfilled and adequate protection from mechanical damage and chemical damage are provided. Fittings shall be wrapped with suitable tape to avoid direct contact with concrete.

7.11 Installation in areas exposed to UV radiation and light

RAUTITAN and RAUTITAN gas system components shall in general not be installed above ground, except for the following:

**Gas application:**
- Short pipe length after connection to gas meter before going in ground
- Connection to an external gas appliance above ground
- Connection to an above ground LPG tank

**Water application:**
- Short pipe length after connection to water meter before going in ground
- Connection to an externally located water heater

For the above exceptions, the following must be ensured:

- The length of pipe installed above ground shall be kept to an absolute minimum not exceeding 2 metres. Below ground installation should always be preferred.
- All pipe and connections must be adequately protected from corrosion, frost and excessive temperature.
- The system components must be protected from any mechanical and physical damages. Consideration shall be given to the type and level of damage which is likely to occur during the long term operation of the system, e.g. UV-radiation, lawn mower, etc.

For specific installation requirements for gas application, refer to chapter 10.5.

- Store and transport pipes with protection against UV radiation.
- Protect piping from UV rays in areas where UV radiation can occur (e.g. sunlight, neon light).
- RAUTITAN PE-Xa pipes shall be installed in dark areas or protected in conduit to avoid biofilm growth.
7.13 Installation below ground

All below ground installations shall follow the applicable water and gas installation standards.

General
RAUTITAN and RAUTITAN gas system components can be installed in the ground if they are adequately protected against mechanical and chemical damage and contamination.

Laying of RAUTITAN pipes in contaminated soil (i.e. petrol, benzene, paint, solvent etc.) is not permitted.

If chemical damage is likely to occur, e.g. from termite treatments, RAUTITAN pipes and fittings shall be adequately protected using a suitable conduit, e.g. PVC pipes or equivalent.

Bedding and backfill
The quality of bedding and backfill material must be in accordance with valid national water and gas installation standards.

Corrosion protection
All joints in ground, except for RAUTITAN PX fitting joints with RAUTITAN PE-Xa pipes, must be protected against corrosion using a recognized corrosion protection system, such as the Denso DEKOTEC N15/PE5 system or equivalent.

For installation of Denso DEKOTEC N15/PE5 corrosion protection system refer to Appendix A1.

When using an alternative Corrosion Protection System:
- Ensure chemical compatibility with RAUTITAN pipes and fittings,
- When using RAUTITAN stabil or RAUTITAN gas stabil ensure there is no adverse effect on the adhesion of the outer PE-layer to the aluminium layer,
- Only use systems which are suitable for the application and ground conditions and include an approved cavity filler/putty that can be applied to profile the joint, allowing smooth application.

The corrosion protection system shall cover a minimum of 150 mm of the pipe on each side of the joint. Ensure mechanical protection is provided to avoid any damage to the corrosion protection tape e.g. by backfill material.

Inadequate corrosion protection of joints may cause corrosion of RAUTITAN stabil, RAUTITAN gas stabil pipes and brass fittings and lead to leakage.

RAUTITAN PX fittings and compression sleeves when installed with RAUTITAN PE-Xa pipes must be mechanically protected, i.e. by laying in a sand bed or by sliding a piece of pipe with larger diameter over the joint.

Repair or extension works
Repair or extension works on RAUTITAN stabil or gas stabil pipes installed in ground are not permitted once the system has been put into operation.

When installed in ground and the outer PE layer of RAUTITAN stabil or RAUTITAN gas stabil pipe gets damaged, the aluminium layer may corrode with time. This may be visually unpleasant but does not affect the long term pressure resistance and performance of the pipe and is uncritical, as long as the joints have been protected from corrosion as described above.

For specific installation requirements for gas application, refer to chapter 10.5
7.14 Exposure to excessive heat

During construction, maintenance or repair work in close proximity to heat care must be taken not to expose RAUTITAN pipe systems to a naked flame (soldering), flood lights or other localised heat sources. This can result in permanent damage or a significant reduction in performance life.

7.15 Aligning fittings

Do not subject fittings and compression sleeves to plastic deformation, e.g. by hammer blows.

7.16 Heat trace

The use of heat trace on RAUTITAN pipes is permissible provided the heat trace temperature is limited to 70ºC at any point.

In pipes installed with pipe support channel the heat trace must be attached to the outside of the pipe support channel.

Observe the installation manual of the auxiliary heating manufacturer and ensure that any tape used to fix the heat trace to the pipe is suitable for contact with RAUTITAN components.

7.17 Potential equalization

RAUTITAN piping shall not be used as an earthing conductor.

After replacement of existing metal pipe installations with RAUTITAN system, the function of potential equalization and the effectiveness of the electrical safety devices must be verified by an electrician.
7.18 Installation in combination with bitumen sheets and coatings

Do not lay pipes under bitumen sheeting. Laying under a bitumen sheeting can lead to damage to the piping or to the bitumen sheeting.

- Allow the bitumen sheets or bituminous coatings that contain solvents to dry completely before installing the pipes.
- Adhere to the setting time specified by the manufacturer.
- Before laying the pipes, ensure that neither the pipes nor the drinking water are adversely affected.
- Protect the pipe adequately from heating while laying the pipes near flaming bitumen sheets.

7.19 Installation in areas with asphalt screed

Hot asphalt screeds are laid at a temperature of approx. 250 °C. To protect the piping from overheating, proper steps need to be taken. Since these depend on the structural conditions and cannot be influenced by REHAU, they must be coordinated with and approved by the planner.

- Do not lay RAUTITAN gas pipes under hot asphalt screed.
- Take the appropriate measures to ensure that RAUTITAN components (e.g. pipes, fittings, compression sleeves, joints) and pipe insulation do not at any point exceed 100 °C.

Consult with the contractor laying the hot asphalt screed and agree on suitable insulation and protective measures to prevent any damage to the pipes due to excessive heat.
The Building Codes of Australia and New Zealand both stipulate that service penetrations must not reduce the fire resistance level/rating of the building element they penetrate.

In Australia, the verification requirements for service penetrations are specified in the National Construction Code (NCC) Vol. 1 under Specification C 3.15 “Penetrations of walls, floors and ceilings by services”.

The approved Document for New Zealand Building Code Fire Safety Clause C lists - under Paragraph 6.17 and Appendix C 6.1 - the requirement tests to prove a selected combination of the fire stop and pipe achieve the required fire resistance rating.

Applicable test methods are detailed in AS 1530.4 (methods for fire tests on building materials, components and structures – Part 4: Fire-resistant tests of elements of building construction).

Every service penetration reacts differently in the event of fire. As this is the case, test results are only applicable to the tested wall or floor construction, installed pipes and the applied fire stops. A fire safety engineer responsible for a particular building can at his discretion accept test results from a different test setup, if he deems the construction in question to be achieving a better fire rating than the one that was tested.

REHAU recommends to only use the fire protection methods which have been specifically tested with the RAUTITAN pipe system. REHAU cannot accept responsibility or liability for the correct manufacture or installation of fire protection systems.

- When planning and assembling fireproof collars, the requirements of the general building construction approval and the specifications of the assembly instructions must be observed.
- When using fireproof collars, the applicable national regulations must be observed.

Approved fire collar solutions for RAUTITAN systems are available from the following manufacturers.

- **Promat** (1800 PROMAT or 1800 776 628 or www.promat.com.au)

Contact the manufacturer of the fire collar for information on fire test results and assembly/installation instructions to determine which solution suits your requirements.
RAUTITAN
WATER SERVICES
9 SPECIFIC GUIDELINES FOR WATER APPLICATION

9.1 Standards and guidelines

RAUTITAN system for water services must be planned, calculated, installed and operated according to AS/NZS 3500 and other relevant standards.

9.2 Operating parameters

For continuous operation, the following parameters must not be exceeded.

Application: Hot water supply at 70°C / 1 MPa (10 bar) (Application class 1-2 acc. ISO 10508)

The above continuous operating parameters are based on a life span of 50 years and allow for short periods of higher temperatures as listed in the following table:

| Design temperature $T_D$ / Time $T_D$ | 70°C / 49 years |
| Short-term maximal temperature $T_{max}$ / Time $T_{max}$ | + 80°C / 1 year |
| Short-term malfunction temperature $T_{mal}$ / Time $T_{mal}$ | + 95°C / 100 h |
| Total | = 50 years |

Tab. 9-1 Operating parameters according to DIN EN 806-2, DIN 1988-200 and ISO 10508 (Application classes 1 and 2)

9.3 Drinking water requirements

The drinking water must comply with the currently valid limits of the following standards:
- Australian Drinking Water Guideline
- Drinking-water standards for New Zealand

The maximum disinfection agent concentration mentioned in above guidelines shall only be applied during temporary disinfection and not continuously. Refer to chapter 9.4.

In locations with highly corrosive water composition, e.g. in volcanic areas, installations using bore/well water etc., the suitability of RAUTITAN pipe system must be checked with REHAU. In some cases, the available water quality may void the REHAU warranty unless appropriate water treatment is provided.

RAUTITAN MX fittings are made of dezincification-resistant (DZR) brass and comply to AS 2345, DIN EN 1254-3, DIN EN 12164, DIN EN 12165 and DIN EN 12168.

Nonetheless, no material does exist that can be used for every application.

In some specific cases, even drinking water qualities within the permitted range of the drinking water guideline and standards have properties that may negatively affect DZR brass fittings and lead to corrosion.

Water chemistry limitations

High levels of chloride contents combined with low levels of hydrogen carbonate contents may negatively influence the corrosiveness of the drinking water and lead to dezincification of DZR brass materials.

To avoid corrosion of RAUTITAN MX and RAUTITAN ONE fittings in drinking water application, the following limits shall not be exceeded:

- Chloride contents (Cl$^-$) ≤ 200 mg/l
- Sulphate content (SO$_4^{2-}$) ≤ 240 mg/l
- Calculated calcite solubility capacity ≤ 5 mg/l (achieved as soon as pH value ≥ 7.7)

Treated drinking water (e.g. softened water) may be corrosive to RAUTITAN components.
- Verify supplied water from the treatment plant suits to all materials used in RAUTITAN water installation system.
- REHAU explicitly recommends to consult an expert or the system manufacturer for an assessment of the individual situation and to ensure correct design, installation and operation of water treatment plants.

It is the responsibility of the system designer to ensure that the above-mentioned factors and parameters are taken into account to prevent corrosion and scaling. If the drinking water quality is outside the limits of the drinking water guidelines or above limits or if previous experience indicates corrosive tendencies of the supplied water, consult REHAU before using RAUTITAN system.

9.4 Disinfection of water services

REHAU pipes intended for drinking water together with the compression sleeve jointing technique without O-ring help to keep the hygiene level of drinking water installation. They correspond to the KTW guidelines of the German Federal Environment Agency and satisfy the requirements of the DVGW worksheet W 270. Thus, they are suitable for fields of application with special hygiene requirements when it comes to drinking water. It has been proven that RAUTITAN pipes for water services and heating installation do not cause any multiplication of micro-organisms and thus do not support microbial contamination or legionella growth.

Due to errors made during planning, construction and operation, during stagnation or substandard water quality (e.g. wastewater, floodwater, maintenance works on the piping network) contamination can occur. Furthermore, damage to the piping network, e.g. a supply line with external water inflow, can be the cause of possible contamination. The disinfection of drinking water installation is only necessary in exceptional cases (in the case of contamination) and all operational and structural engineered system deficiencies are to be rectified first.

Repeated or constant bacterial exposure of domestic water installation is often caused by the installation method (e.g. stubs) or by the operation method (e.g. long stagnation periods), as such that continuous disinfection is not justifiable.
9.4.1 Thermal disinfection in case of contamination

For drinking water installations in compliance with the latest technical standards (no stubs, etc.), removal of dirt can be done by thorough water rinsing as long as the dirt is water-soluble or remains soluble in water.

If contamination is suspected, an additional thermal disinfection as per DVGW worksheet W 551 is possible as a sensible and urgent measure. According to the latest technological standards, for water with temperature of at least 70°C, it is very likely that germs and bacteria, including legionella which is found freely in water will be killed off. It is important that the appropriate measures have to be taken to avoid scalding to people.

All RAUTITAN piping system for water services and heating installation are suitable for multiple thermal disinfections according to DVGW worksheet W 551 at 70°C. It must be ensured that the allowable operating pressure is not exceeded during thermal disinfection.

9.4.2 Chemical disinfection in the case of contamination

Alongside with thermal disinfection, chemical disinfection is being used more and more. Chemical and thermal disinfection measures always strain the materials used in water services installation. According to today’s level of awareness, some disinfection measures are not suitable for standard materials in installation technology. This also applies to materials, for which it was previously assumed that they were sufficiently corrosion-resistant, e.g. stainless steel, copper and some synthetic materials.

Before introducing these types of process measures, it needs to be ensured that all parts of the installation system are thermally and chemically suited for the corresponding measure. This is regulated by DVGW worksheet 551. If necessary, please have the suitability of the disinfectant approved by the disinfectant’s manufacturer for all system parts of the installation.

9.4.3 Chemical “Postrinse disinfection”

For short-term chemical disinfection (postrinse disinfections), only special active ingredients may be used which are specified in corresponding rules and standards.

Carrying out the disinfection measures according to the specifications of DVGW worksheet W 291 can be done without impairing the functionality of REHAU drinking water installation if the active ingredients, concentrations, application duration and maximum temperatures are observed (as listed in Table 9-2)

It should be noted that combining thermal-chemical disinfection at temperatures of higher than 25°C, as well as permanent or regular disinfection cycles (e.g. monthly), are not permitted. In relation to the lifespan of the piping, the total number of disinfection cycles is limited to five “postrinse disinfections”. Otherwise, it cannot be guaranteed that the specified lifespan will be reached.

The person carrying this out must guarantee that the water is not used for human consumption (e.g. as drinking water) at any time during the disinfection phase, including the subsequent rinsing phase.

Tab. 9-2 Chemical postrinse disinfections, active ingredients and concentrations according to DVGW W 291

5) The corresponding notes in the safety data sheets of the manufacturer must be adhered to.
6) REHAU approval: this value may not be exceeded at any stage of the entire application duration of the installation.
Continuous chemical disinfection

We cannot recommend using indefinite chemical disinfection in domestic installation, especially as a preventive measure for legionella prophylaxis, due to the possible occurrence of material damages to installation components. We cannot provide any guarantees in these cases.

In some cases, it may be the case that chemical disinfection may be necessary for a long time, but finite period of time, until structural decontamination has been completed. These disinfection measures may only be carried out if the permitted method is used. The parameters listed in Table 9-3 must be monitored and documented for the full duration of the disinfection measure, immediately after the dosing point. If the active ingredients, concentrations, application durations and maximum temperatures as listed in Table 9-3 are adhered to, execution without impairing the functionality of REHAU drinking water installation is possible.

Tab. 9-3  Chemical disinfection with finite period according to drinking water ordnance 2001

1) The corresponding notes in the safety data sheets of the manufacturer must be adhered to.
2) REHAU approval: this value may not be exceeded at any stage of the entire application duration of the installation.
3) Maximum application duration is an accumulation of the entire system lifespan.

In relation to the lifespan of the pipe, the full application duration is limited to four months. Otherwise, it cannot be guaranteed that the specified lifespan will be reached.

We generally exclude other non-listed disinfectant from being used, especially strong oxidants (e.g. ozone).
9.5 Thermal insulation

Thermal insulation requirements for hot and cold water services are specified in the National Construction Code NCC and in AS/NZS 3500.

In cold water applications, the likelihood of pipe damage due to freezing can be reduced. It is, however, not possible to prevent static water from freezing completely. For longer periods during which freezing is likely to occur, pump warm water periodically through the pipe system. Alternatively, the complete system could also be drained.

REHAU offers pre-insulated pipes with 13 mm concentric insulation to minimize heat loss in hot water applications.

![Fig. 9-1 Pre-insulated pipe](image)

**Material:** Co-extruded PE-foam with moisture barrier PE layer, CFC free.
**Thermal conductivity:** 0.04 W/mK
**R-value:** 0.3
**Spread of Flame Index:** 5
**Smoke Developed Index:** 5
**Suitable use:** installation in concealed areas in all types of building specified by BCA

Pre-insulated pipes are not suitable for exposed installation in fire-isolated areas.

9.6 Noise reduction

**Acoustic properties of PE-Xa pipes:**
Fraunhofer Institute for Structural Physics in Stuttgart conducted a study of the sound level differences of PE-Xa, copper and galvanized steel pipes. Three common pipe diameters were compared under identical conditions such as dynamic pressure and flow rate.

The report shows that PE-Xa pipes generated up to four times less noise (sound level difference LA = 12.7 dBA) than the metal pipes. A complete copy of the report is available on request.

**Effects of water hammer:**
The low elastic modulus of PE-Xa pipes and their ability to expand quickly and contract slowly enables the pipes to absorb water hammer effectively.

In cold water service installations, the water hammer effect can be reduced by up to 75% compared to metal pipe installations.
9.7 Water heater connection

REHAU recommends the installation of both isolation valve and non-return valve connected directly to the inlet of every water heater or with metallic piping between the valves and the water heater. REHAU recommends that the non-return valve be connected closest to the water heater and with the isolation valve at the up-stream of the non-return valve.

RAUTITAN platinum and RAUTITAN red system can be used for re-circulating hot water systems provided the operating temperature and pressure does not exceed the capabilities of the piping system.

9.7.1 Storage water heaters

All storage water heaters should be fitted with operational temperature and pressure relief valves for safety in the event of malfunction of the heater’s operation. The rating of the temperature and pressure relief valve must be determined by the storage water heater manufacturer in terms of maximum temperature and pressure as required for the design and operational requirements of the water heater.

If the storage water heater does not have provision on the heater for fitting such a valve, REHAU recommends the installation of a temperature and pressure relief valve on the tee-connection of the heater’s hot water outlet and its outlet piped to a drain location. This will allow the release of hot water during the heater’s normal operation and in the event of safety operation of the valve. REHAU also recommends that the valve be operated manually every six months.

REHAU recommends that the outlet of storage water heaters be fitted with a minimum of 1 meter of metallic piping prior to the installation of RAUTITAN platinum or RAUTITAN red system.

9.7.2 Instantaneous water heater

Before connecting RAUTITAN piping system to either electric or gas fuelled instantaneous water heaters, the installer must check the appliance manufacturer’s instructions regarding the connection of polymer pipes. The appliance operational temperature and pressure may exceed the capabilities of RAUTITAN piping and might cause failure of the piping system. Some manufacturers of instantaneous water heaters state that connection of their appliances to polymer piping systems is not suitable or subject to restrictions.

The installer must confirm with the appliance manufacturer that the maximum operational limits of the appliance will not exceed those of the piping system. REHAU recommends that only appliances with temperature control devices which can, at all times, restrict the outlet water temperature to within RAUTITAN piping system’s capabilities, be installed in conjunction with RAUTITAN piping system.

9.7.3 Water heaters with uncontrolled energy sources

RAUTITAN platinum and RAUTITAN red pipes should not be used with uncontrolled energy sources and installation of a tempering valve is required.

9.7.4 Solar water heaters

As per AS/NZS 3500 requirement, polymer pipe systems must never be used on the flow and return piping to any solar panel.

Solar collectors and other uncontrolled heat sources generally have operating conditions which exceed those of RAUTITAN pipe system.
- Never use RAUTITAN pipes in the flow and return piping to any solar collectors/panels.
- Do not install RAUTITAN pipes in the flow and return of any uncontrolled heat source (e.g. wood fire heaters, etc.).
- If a heat storage tank is used, RAUTITAN pipes can be used after the tempering valve. Potential back siphoning of super heated water through the cold port of the tempering valve from cold feed to the uncontrolled heat source (including solar panels) must be prevented through adequate measures, e.g. fitting a suitable high temperature rated non-return valve between the cold feed to the solar panels and the tempering valve.
9.8 Rainwater application

**Pipe identification**
RAUTITAN green pipes are clearly identified as rainwater plumbing pipes by its special green outer coating and the marking "RAINWATER" as required by AS/NZS 3500 regulation.

**System integration**
For applications where rainwater is also used for drinking water, the local council or water authority may have imposed special restrictions regarding water treatment and compliance with the Australian Guidelines for Drinking Water. Conduct a careful check on the local requirements before contacting REHAU with regard to the suitability of RAUTITAN green for this application.

**System installation**
Installation must be carried out by a licensed plumber, adhering to the requirements of AS/NZS 3500 and that of the local water provider.

The installation of filters or screens on tank inlets and outlets is recommended to protect the appliances and the rainwater plumbing system from becoming clogged with sludge from sediments and organic materials.

Periodically check the pH level of tank water and ensure a pH level of 6.5 to 9 is maintained. This can be done by e.g. fitting a suitable inline filter system at the tank outlet.

Do not add kerosene into the rainwater tank for mosquito control as this can have an adverse effect on your tank and the polymer piping.

**System maintenance**
Guidelines on rainwater tanks from your local authority should be observed.

Rainwater varies in its chemical composition with the geographical location and aggressive water can accelerate wear and tear on metal components of the system.
- Periodically check the pH level of tank water and ensure a pH level of 6.5 to 9 is maintained.
- Do not add kerosene into the rainwater tank for mosquito control as this can have an adverse effect on your tank and the polymer piping.

9.9 Recycled water application

**Pipe identification**
RAUTITAN lilac pipes are clearly identified as recycled water plumbing pipes by its special lilac outer coating and the marking "RECYCLED OR RECLAIMED - WATER - DO NOT DRINK" as required by AS/NZS 3500 regulation.

**System installation**
Installation must be carried out by a licensed plumber, adhering to the requirements of AS/NZS 3500 and that of the local water provider.

**System limitations and water quality**
The main application for RAUTITAN lilac plumbing systems are dual reticulation systems. Different states in Australia may have different guidelines for recycled water applications, adhere to the state-specific guidelines.

RAUTITAN lilac system shall only be used with highly treated recycled/reclaimed water (Class A and higher) and dual reticulation system. RAUTITAN lilac system is not suitable for use with Class B - D treated recycled/reclaimed water and direct untreated water reuse on domestic dwellings.

Typical applications for Class A recycled/reclaimed water are:
- Residential (non-potable)
  - Garden watering
  - Toilet flushing
  - Car washing
- Irrigation food crops to be consumed raw
- Municipal with uncontrolled public access
- Primary contact recreation

Corrosive water can accelerate wear and tear on metal components of the system. Refer to chapter 9.3 and 9.4 for specific water quality requirements to prevent corrosion in RAUTITAN system.

In some cases, the available water quality may void the REHAU warranty unless appropriate water treatment is provided.
9.10  Water services flushing and pressure test

9.10.1  Flushing and pressure test

A visual check shall be carried out prior to pressure testing to ensure all compression sleeve joints have been secured completely.

Flushing of the system shall occur prior to and after pressure testing.

Flushing and pressure testing may be conducted in accordance with AS/NZS 3500, or by following the REHAU recommendations below.

The successful execution and documentation of a pressure test is a prerequisite for any warranty claims from REHAU.

Notes
The temperature difference between the pipe and test medium may influence the pressure test and may give false readings. A temperature change of 10°C corresponds approximately to a pressure change of 0.5 to 1 bar (50 to 100 kPa). For this reason, every effort should be made to ensure that the temperature of the test medium remains constant during the pressure test.

In this context, it is important to carry out a visual inspection of all joints while the pressure test is in progress, since experience has shown that minor leakages cannot always be detected simply by monitoring the pressure gauge.

9.10.2  REHAU Pressure test with water

The REHAU recommended pressure test procedure is an alternative solution to the requirements as described in AS/NZS 3500.

General requirements and notes:
- Conduct the pressure test on the completed but not yet concealed piping before commissioning.
- During pressure test, conduct a visual check of all unconcealed pipe work as the system’s leak-tightness can’t be derived from the pressure fluctuation (constant, decreasing, increasing) alone.
- Subdividing the piping system into smaller test sections may increase the test accuracy.

Preparation
1. Piping shall be accessible and not be concealed.
2. Dismount safety devices and meters as necessary and replace with pipes or pipe stoppers.
3. Fill the piping system from the lowest point with filtered drinking water and purge all air. Ensure all outlets are closed.
4. Connect the pressure testing equipment at the lowest point on the drinking water installation. The measurement precision shall be 100 hPa (0.1 bar) or better.
5. During pressure test, ensure temperature fluctuations are kept to a minimum.

Pressure test for installations with RAUTITAN stabil pipes

Fig. 9-3  Pressure test diagram for RAUTITAN stabil
A  Adaptation time (if necessary restore the pressure)
B  Pressure test for installations with RAUTITAN stabil and installations with RAUTITAN stabil pipes mixed with metal pipes
1. Slowly build up test pressure to 11 bar (1,100 kPa) in the piping system.
2. If the difference between ambient temperature and water temperature is greater than 10ºC, wait 30 minutes to adjust.
3. Check the test pressure after 10 minutes and adjust it to 11 bar (1,100 kPa) if necessary.
4. During testing, perform a visual check on all joints and pipe work for leaks.
5. Record pressure in the piping system after a test period of 30 minutes.
   - Repeat visual inspection of the installation, outlets and joints.
   - After resolving the cause of pressure loss, repeat steps 1 - 5.
6. Pressure test ends once no leaks are detected during visual inspection.

**Completion of REHAU pressure test with water**

1. Fill and sign pressure test protocol, refer to Appendix A7.
2. Detach the pressure test equipment.
3. Thoroughly flush and empty the drinking water pipes for hygiene purposes (see chapter 9.10.4).
4. Reinstall all removed safety devices and meters.

In sub-zero conditions or if the drinking water installation is commissioned at a later stage, thoroughly drain all pipe work for hygienic reasons. Repeat flushing the pipe system before commissioning, or periodically if water stays in the pipe system for longer periods.

### 9.10.3 REHAU Pressure test with air

The REHAU recommended pressure test procedure is an alternative solution to the requirements as described in AS/NZS 3500.

**Important information on tests with pressurised air and inert gas:**
- Use only oil free pressurised air or inert gas.
- Small leaks may only be detected using leak detection agents at high test pressures (load test) and visual inspection.
- Temperature fluctuations may affect the test result (pressure loss or increase).
- Pressurised air and inert gas are compressed gases. This means that the piping volume has a lot of influence on the shown pressure result. A high piping volume reduces the determination of small leaks using pressure reduction.

**Leak detection agents**

Only use leak detection agents (e.g. foaming agents) with current DVGW certification, which are also approved by the respective manufacturers for PPSU and PVDF materials.

**General requirements and notes:**
- Conduct the pressure test on the completed but not yet concealed piping before commissioning.
- During pressure test, conduct a visual check of all unconcealed pipe work as the system’s leak-tightness can’t be derived from the pressure fluctuation (constant, decreasing, increasing) alone.
- Subdividing the piping system into smaller test sections may increase the test accuracy.

**Preparation**

1. Piping shall be accessible and not be concealed.
2. Dismount safety devices and meters as necessary and replace with pipes or pipe stoppers.
3. Install air purges in appropriated locations to allow a safe drain after completion of the test. Ensure all outlets are closed.
4. Connect the pressure testing equipment. The measurement precision shall be 1 kPa (1 mbar) or better.
5. During pressure test, ensure temperature fluctuations are kept to a minimum.

</tr>
</tbody>
</table>

1) Approximate values, depending on the piping volume
Tab 9-4  Pipe volume, adaptation time and test time

1. Slowly build up the test pressure to 150 mbar in the piping system.
2. Let the adaptation time (refer to Tab. 9-4) pass. If necessary restore the test pressure.
3. During the pressure test, perform a visual check on all joints and pipe work using a suitable leak detection agent
4. Record pressure in the piping system after the test time (refer to Tab. 9-4).
   If the test pressure has fallen:
   - Repeat visual inspection of the installation, outlets and joints.
   - After resolving the cause of the drop in pressure, repeat steps 1 - 5.
5. Pressure test is complete once the visual inspection confirms no leaks.
6. Test protocol is found in Appendix A8.

---

**Pressure test with air step 2 – load test**

1. Slowly build up the test pressure to 3 bar (300 kPa) in the piping system.
2. If necessary, restore the test pressure after the pressure has stabilised.
3. During the pressure test, perform a visual check of all joints and pipe work using a suitable leak detection agent
4. Record pressure in the piping system after 10 minutes.
   If the test pressure has fallen:
   - Repeat visual inspection of the installation, outlets and joints.
   - After resolving the cause of the drop in pressure, repeat steps 1 - 5.
5. Pressure test is complete once the visual inspection confirms no leaks.
6. Test protocol is found in Appendix A8.
7. Securely drain the air out of the pipe system.

**Completion of REhAU pressure test with air**

1. Fill and sign pressure test protocol in Appendix A8.
2. Detach the pressure test equipment.
3. Thoroughly flush and empty the drinking water pipes for hygiene purposes (see chapter 9.10.4).
4. Reinstall all removed safety devices and meters.

In sub-zero conditions or if the drinking water installation is commissioned at a later stage, thoroughly drain all pipe work for hygienic reasons.

Repeat flushing the pipe system before commissioning, or periodically if water stays in the pipe system for longer periods.

---

**9.10.4 Purging and commissioning**

Before commissioning the drinking water system, dirt from the construction phase has to be flushed out:

1. Open all outlets in sequential order and for several minutes.
2. If purging with drinking water alone is not efficient or if coarse dirt is visible in the piping system, it is recommended to purge the system alternating with water and pressurised air for several minutes or until all dirt has been flushed out.
3. If the drinking water system won’t be operated immediately after commissioning, it is recommended to completely drain the drinking water lines for hygiene purpose. Purge the drained system thoroughly before recommissioning.
4. If water has to stay in the piping a long time before the system is put into operation, purging of the installation has to be periodically repeated for hygiene reasons.
5. In sub-zero conditions it is recommended to completely drain the drinking water lines to avoid freezing. Purge the drained system thoroughly before commissioning.
RAUTITAN
GAS SERVICES
10.1 RAUTITAN gas connection components and tools

This Technical Information describes the components and requirements for the installation of RAUTITAN gas system using RAUTITAN ONE fittings and RAUTITAN PX polymer sleeves.

Components and assembly requirements for RAUTITAN gas system using RAUTITAN gas brass fittings and sleeves delivered as a SET are described in the respective sections of REHAU’s Technical Informations “Piping, Connection and System Guidelines” (No. ANZ GT 0064.05.12 EN) and “RAUTITAN GAS Installation System” (No. ANZ 872 0281.10.09).

10.2 Standards and guidelines

RAUTITAN gas system for gas installation system must be planned, calculated, installed and operated according to AS/NZS 5601.1.

RAUTITAN gas system

RAUTITAN gas system must be installed according to AS/NZS 5601.1. It can be used for supply of Natural Gas (NG) and Liquefied Petroleum Gas (LPG) with normal operating temperature of 60°C and can also temporarily withstand temperature of up to 90°C.

The complete RAUTITAN gas system is designed for installation in new buildings, and for carrying out renovations and repairs. It is suitable for gas installation systems in buildings for residential, industrial and commercial use such as hospitals, schools, kindergartens, sports halls, churches, aged care facilities, supermarkets and services stations, as well as industrial premises, etc.

RAUTITAN gas stabil pipe must not be used for drinking water or heating installations.

10.3 Operating parameters

For continuous operation, the following parameters must not be exceeded.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continuous operating temperature</td>
<td>Maximum 60°C</td>
</tr>
<tr>

10.4 System accessories

10.4.1 RAUGUARD protective conduit

According to national gas installation standards, gas consumer piping must not be located where physical damage to the pipe is likely to occur, unless adequate protection is provided. Such damage can be caused, among other things, from rodents or other vermin.

RAUGUARD provides adequate protection to RAUTITAN gas stabil pipes against:
- Vermin attack
- Mechanical damage through nails, hammer, etc
- UV radiation

RAUGUARD is available in five sizes:

<table>
<thead>
<tr>
<th>Description</th>

<tr>
<td>RAUGUARD 40+</td>
<td>40 x 6.0</td>
</tr>
</tbody>
</table>

Tab. 10-4 Available RAUGUARD sizes and respective RAUTITAN gas stabil pipe sizes

- RAUGUARD protective conduit is not gas-tight and cannot be used for discharging gas from unvented into vented areas or to the outside of a building.
- RAUGUARD protective conduit is zinc plated to protect against corrosion, under normal operating conditions. Permanent or reoccurring exposure to corrosive environments or chemicals or any liquids can cause permanent damage to the conduit compromising the protective function.

10.4.2 Protective conduit (PE)

For protection against most chemical and mechanical damages other than vermin attack, a yellow protective conduit (PE) can be used for the gas pipe RAUTITAN gas stabil.
10.5 Installation of RAUTITAN gas system

10.5.1 REHAU Authorised Installer

RAUTITAN gas system shall only be installed by REHAU trained and authorised installers. Authorisation is obtained through attendance of a REHAU organized training session and successful completion of a written test.

Upon completing the REHAU training session and written test, authorised installers will be registered on a REHAU internal database and issued with a REHAU identification card as shown below.

![REHAU Authorised Installer Identification Card](image)

Installers should be aware that a verification process is in place at the point of sale and that they may be asked to present their REHAU ID card before the transaction is processed.

10.5.2 Gas installation requirements

This chapter outlines specific guidelines and requirements for the installation of RAUTITAN gas system in addition to the general installation requirements as outlined in chapter 7. They shall not be interpreted as substitution or negation of the requirements set out in AS/NZS 5601.1.

AS/NZS 5601.1 sets out the requirements for installing consumer gas piping in Australia and New Zealand and shall be observed at all time. Gas consumer piping shall not be located where physical damage to the pipe is likely to occur, unless adequate protection is provided. Such damage can be caused, among other things, through rodents or vermin. The system needs to be designed and installed in such a way that damages caused by corrosion, stress and other means are avoided.

If RAUTITAN gas stabil pipe is used in a location accessible to rodent or vermin (e.g. wall cavities, roof spaces, sub-floor cavities or ducts where the pipes are not fully embedded into concrete) RAUGUARD flexible metal conduit should be fitted to protect the pipe from damage. Refer to Appendix A2 to learn how to use RAUGUARD.

RAUTITAN gas stabil pipe and fittings must not be subjected to mechanical, physical or chemical damage.

Select the type of protection depending on specific site conditions and the intended building use, e.g.:
- System connection to isolating valve of an oven or heater which could be exposed to aggressive cleaning agents, cooking oils, greases, etc.
- Exposed components which may get painted on by end users.

Use either RAUGUARD or the yellow REHAU protective conduit as appropriate.

### Installation in wooden joists or steel frames

Avoid holes and notches in wooden joists wherever possible. If crossing wooden joists or steel frames:
- Adequately size pipe penetrations in wooden joists or steel frames.
- Use pipe grommets or similar to protect the pipe from damage.

### Damages to the outer PE layer of RAUTITAN gas stabil may cause corrosion to the Aluminium layer and compromise the integrity of the joint

### Concealed locations - cavities, roof spaces and suspended floors

Consider the potential mechanical damages caused by trades or later by building occupants (power drills, staplers, nail guns and similar tools) and install the pipes accordingly to prevent such damage, e.g. through
- Sufficient clearance between the gas pipes and finished wall/floor/ceiling surface.
- Application of a protective conduit.
- Application of RAUGUARD metal conduit if the location is accessible to vermin.
- Minimize the number of joints used in unvented areas.

RAUTITAN gas system joints are classified as permanent joints in accordance with AS/NZS 5601.1.
Embedded in concrete – walls or slabs

Ensure that no sharp-edged steel parts or equivalent can damage the pipe when installing RAUTITAN gas stabil in concrete walls or floors or in between concrete reinforcement.
- Protect the pipe from sharp edges and stones.
- AS/NZS 5601.1 allows no fittings or joints for pipe embedded in concrete.

Below ground beneath a building:

Ensure that no sharp-edged steel parts or any shattering can damage the RAUTITAN gas stabil pipe when installed in ground beneath a building:
- Use conduit to protect RAUTITAN gas stabil pipe from sharp edges and stones.
- AS/NZS 5601.1 allows no fittings or joints for pipe installed below ground beneath buildings.

External below ground

Refer to chapter 7.13 for details on installation and protection of pipes and fittings installed below ground.
- Minimize the number of joints.
- Adequately protect fittings to prevent corrosion.

External above ground

RAUTITAN gas system shall in general not be installed above ground, except for the following:
- Short pipe length after connection to gas meter before going in ground
- Connection to an external gas appliance above ground
- Connection to an above ground LPG tank

The length of pipe installed above ground shall be kept to an absolute minimum not exceeding 2 metres. Below ground installation should always be preferred.

RAUTITAN gas stabil pipe shall not be used to support the gas meter. Use an appropriate support frame and brackets to support the gas meter.

Refer to chapter 7.12 for details on installation and protection of pipes and fittings installed above ground.

Installation in areas prone to vermin

If RAUTITAN gas stabil pipe is used in a location accessible to rodent or vermin (e.g. wall cavities, roof spaces, sub-floor cavities or ducts where the pipes are not fully embedded into concrete) then the protective conduit RAUGUARD should be fitted over the pipe. Failure to fit the protective conduit RAUGUARD in these circumstances could result in rodents or vermin gnawing through the pipe and a gas leak.
- RAUGUARD protective conduit should be used in areas prone to vermin.
- RAUGUARD protective conduit is not gas-tight and cannot be used for discharging gas from unvented into vented areas or to the outside of a building. If used in such a way, gas can leak through the conduit.
- RAUGUARD protective conduit is zinc plated to protect against corrosion, ensuring a safe, reliable and long lasting performance under normal operating conditions. Permanent or reoccurring exposure to corrosive environments or chemicals or any liquids can cause permanent damage to the conduit. If such permanent damage occurs, the protective function of RAUGUARD for RAUTITAN gas stabil, e.g. against vermin, is compromised. This can result in gas leak due to vermin attack or through other physical damage.

More detailed information on how to install RAUGUARD can be found in Appendix A2.

Using No.19BP wall elbows with parallel thread:

Where no practical alternative is available, AS/NZS 5601.1 allows connections between a running nipple with external parallel thread (male) to internal parallel threads (female). Connections with tapered threads in accordance with ISO 7-1 shall be preferred.

When jointing RAUTITAN ONE No.19BP wall elbow with external parallel thread (male) to an internal parallel thread (female), the installation must comply with the requirements of AS/NZS 5601.1 Clause 4.4. - Either the joint is welded before RAUTITAN gas pipe is connected to the fitting, or a suitable certified quick-setting thread compound has to be used.
Reversion fittings

AS/NZS 5601.1 includes specific requirements for the installation of reversion fittings in multiple appliance installations Class I buildings in Australia or detached or multi-unit dwellings in New Zealand where the pipe main run exceeds 10m in length.

Reversion to a standard thread complying to ISO 7-1 (BSPT) or a standard annealed copper tube shall be provided at both the following accessible locations:

a) In the main run immediately prior to the first branch take off point,
   b) In the main run immediately prior to the last branch take off point.

System Identification label

Fig. 10-5 REHAU system ID label

AS/NZS 5601.1 requires the gas fitter to fit an identification label close to the meter box or at an accessible location to identify the installed gas pipe system.

Different brands of composite gas pipe systems are not dimensionally compatible. Fittings and tools from one brand cannot be safely used on another brand. The system identification label clearly identifies the installed system preventing an accidental mix-up of components.

- Attach the REHAU system identification label on every installation adjacent to the gas meter or gas bottle (not on the meter or bottles themselves as these may get replaced!).
- Complete each label with the required information using a permanent pen or marker.

10.5.3 Prohibited locations

REHAU explicitly prohibits the installation of its RAUTITAN gas system in any of the following areas:

- In emergency escape routes and emergency stairways and corridors
- Space between emergency stairways and the outside
- Lift wells
- In clothes chutes or rubbish chutes
- In a fire hydrant or fire hose reel cabinet
- In a fire control room
- As a final connection to appliances
- Locations where pipes are permanently exposed to any liquids
- External installations exposed to UV-radiation
- Locations with unprotected pipes where UV exposure is likely

Check with your local building regulatory authority for further restrictions.

10.6 Pressure testing RAUTITAN gas system

Pressure testing shall be carried out in accordance to the procedures specified in the respective gas installation standards in Australia and New Zealand.

Installation and commissioning of RAUTITAN gas stabil installations shall only be carried out by licensed gas fitters or persons licensed / authorized by the gas network operator, who are also registered and authorized RAUTITAN gas installers.

The pressure tests and associated procedures as described in the respective gas installation standards are compulsory for the RAUTITAN gas system.

A pressure test protocol can be found in Appendix A6

Leak detection agents

Only use leak detection agents (e.g. foaming agents) with current DVGW certification, which are also approved by the respective manufacturers for PSU and PVDF materials.
11 SIZING RAUTITAN GAS SYSTEM

11.1 General

The RAUTITAN gas system shall be designed, calculated, installed and operated in accordance with the national gas installation standards.

When sizing new installations, foreseeable future extensions and needs should be taken into consideration.

Prior to connecting new appliances to an existing gas consumer piping, the existing pipework, gas meter and pressure regulator have to be checked for adequate capacity to accommodate the additional load.

Prior to pipe sizing, the following information must be obtained:
- The type of gas: LPG or NG.
- The gas consumption of each appliance (MJ/h).
- Diversity factor. An allowance to reduce the load where there is a probability that not all appliances will be used simultaneously.
- The available pressure at point of delivery (gas meter).
- The allowable pressure drop. The pressure drop shall be taken into consideration to ensure that the minimum pressure required by the appliance is available.
- The proposed layout of the consumer piping system, including all the pipe lengths and the location of each appliance.

11.2 Pipe sizing method

Gathering basic information
This first step of the gas pipe sizing method includes:
- Knowing the type of gas and the allowable pressure drop.
- Obtaining house floor plan with the intended gas appliance locations.
- Sketching the intended gas piping layout.
- Determining the length of each pipe section, i.e. from gas meter to first T-piece, from T-piece to the appliance, from T-piece to the next T-piece, etc.

Preliminary gas pipe sizing
This step is the first guess of the gas pipe diameter by considering only the length of each pipe section, excluding the gas fittings used in each pipe section. This step includes:
- Determining the load of each gas appliances in MJ/h.
- Calculating the required load for each pipe section.
- Identifying the preliminary Main Run, this is the longest pipe run from the gas meter to the farthest appliance.
- Selecting the gas pipe size based on the preliminary Main Run length by using the relevant gas tables available in Appendix A3 or A4. Select the column with the same or next greater length than the preliminary Main Run. This column will be used throughout the preliminary gas sizing step for all the pipe sections.

Adding Fitting’s equivalent pipe length
RAUTITAN gas fittings can be classified into three different fitting types, each of the fitting type has different equivalent pipe length according to its size. This is to accommodate a better accuracy in sizing the gas pipe.

Based on the preliminary gas pipe sizing, select the relevant fitting’s equivalent pipe length from Appendix A5 and add the values into each of the pipe section.

For T-piece fittings located within the main run but branching to the appliances, those fittings will have to be considered twice, once as a T-flow (in the main run pipe section) and another time as a T-branch (in the pipe section branching to the appliance).

Confirming the preliminary pipe sizing
This last step of pipe sizing takes into account the gas fittings installed in each pipe section. This last step includes:
- Establishing the total equivalent pipe length for each pipe sizing (including the pipe length and the fittings’ equivalent pipe length).
- Identifying the Final Main Run. The Final Main Run may include different pipe sections compared to the Preliminary Main Run.
- Selecting the gas pipe size based on the Final Main Run length by using the relevant gas tables available in Appendix A3 or A4. Select the column with the same or next greater length than the Final Main Run. This column will be used throughout the final gas sizing step for all the pipe sections.
11.3 Working example

The working example given below is to help understand the pipe sizing method further.

Step 1: Basic information:
- Gas type: NG
- Allowable pressure drop: 0.75 kPa
- Proposed layout of the consumer piping system, pipe section lengths, required fitting types, and appliance loads are shown in the illustration below.

![Fig. 11-1 Proposed layout of gas piping system](image)

<table>

</tr>
</tbody>
</table>

Tab. 11-1 Fitting symbol used in working example

Step 2: Preliminary pipe sizing

- Based on the known basic information, we should use gas table for NG with allowable pressure drop of 0.75 kPa.
- Calculate the Preliminary Main Run, which is the longest pipe run from the gas meter (in this case from gas meter to central heater), is 8 (A-B) + 4 (B-C) + 2 (C-D) + 5 (D-E) = 19 meters.

![Tab. 11-2 Load calculation](image)

- Use the relevant gas table and identify the column to be used. Since there is no column with Main Run value of 19 meters, use the next higher value, which is 20 meters.
- Calculate the load of each pipe section (see Table 11-2 for load calculation for each pipe section).
- Select the correct pipe size that can carry the same or higher load rating for each pipe section.
Pressure drop of 0.75 kPa  
(Supply pressure of around 2.0 - 2.5 kPa)

Tab. 11-4 Adding fittings into the calculation

*EPL = Equivalent pipe length, refer to Appendix A5
- Add the fittings’ Equivalent Pipe Lengths into each pipe section (refer to Appendix A5) based on the preliminary pipe sizing. Please note that T-pieces at point B, C and D have to be considered twice. Those T-pieces are considered as T-flow for pipe sections B-C, C-D and D-E, and considered as T-branch for pipe sections B-F, C-G and D-H.

### Tab. 11-5 Adding fittings’ equivalent pipe length into the calculation

<td>1</td>
</tr>
</tbody>
</table>

### Step 4: Confirming the preliminary pipe sizing
- Establish the Final Main Run using the new pipe section lengths. In this case the Final Main Run is 12 (A-B) + 4.5 (B-C) + 3.5 (C-D) + 6 (D-E) = 28.5 meters.
- Use the same load of each pipe section as in step 3.
- Identify the column to be used, as there is no column with Main Run value of 28.5 meters, look for column with value of 30 meters.
- Select the correct pipe size that can carry the same or higher load rating for each pipe section.

### Pressure drop of 0.75 kPa
(Supply pressure of around 2.0 - 2.5 kPa)

A5  RAUTITAN Gas fittings - Equivalent pipe lengths
A6  Form: Pressure test for gas application
A7  Form: Pressure test for water application (Test medium: water)
A8  Form: Pressure test for water application (Test medium: air)

*Note:
Pressure loss tables for RAUTITAN PE-Xa pipes (cold and hot water) and RAUTITAN stabil pipes (cold and hot water) can be found on www.rehau.com.au/RAUTITAN or www.rehau.co.nz/RAUTITAN
Incorrect application of the system components can compromise its performance and result in gas fitting corrosion. Corroded components can cause joint failure and lead to leakage.
- For more detailed information on correct handling and application, carefully read the individual instruction leaflets supplied with each component of the Corrosion Protection System prior to use.
- REHAU requires a minimum protection extension of 150 mm to each side of the joint. This minimum requirement overrules some of the manufacturers’ instruction.

The procedure of corrosion protection system given below is only an example specific to DEKOTEC N15/PE5 system. Other equivalent corrosion protection systems may have different procedure and tape colours. Please follow the procedures given by corrosion protection systems’ manufacturers.

**STEP 1:** Surface preparation of protection area

- Clean the protection area, ensure that it is dry and free from grease and dust.

- Completely remove any contamination which might act as a release agent (e.g. grease, oil, coupling agents, paint, cement, varnish, etc.) prior to tape application.
- Roughen the cleaned pipe surface 150 mm on each side of the joint using coarse emery cloth. Remove any grinding dust afterwards.

- Thoroughly stir the corrosion protection primer in original container to ensure uniformity prior to application.
- Using a brush or roller apply an even coating of primer to the cleaned and dried surface over the entire protection area. Surfaces have to be uniformly coated and cover must extend for a minimum of 150 mm on each side of the fitting (complete protection area).
- After use immediately seal the primer container.
- Clean the brush or roller with suitable solvent (e.g. white spirit).

**Fig. A1-1** Protection area for corrosion protection system

**Fig. A1-2** Roughen the pipe surface and clean the grinding dust after the roughening process

**Fig. A1-3** Primed protection area surface
STEP 2: Profiling the protection area

- Gaps and voids between pipe/fitting and the corrosion protection tape must be avoided to ensure proper protection.
- The fitting has to be contoured to ensure full contact between the corrosion protection tape and the substrate being protected. Corrosion protection mastique is to be used for profiling as part of the corrosion protection system.

![Fig. A1-4 Filling the gaps between fitting and pipe with mastique](image)

![Fig. A1-5 Profilled protection area](image)

STEP 3: First wrap of the protection area

- Starting at one end of the protection area (minimum 150 mm from compression sleeve) apply the inner tape (grey colour) with one circumferential wrap and continue wrapping it spirally with minimum 50% overlap across the complete protection area.
- Apply slight pressure while wrapping to ensure good bonding to the substrate.
- Keep the tape under tension to avoid any kinks and creases. A good indicator for sufficient tension is if the tape’s width is narrowed by approximately 1% during application. Remove the separating foil.

![Fig. A1-6 Wrapping the protection area with the first tape (grey colour)](image)

STEP 4: Final wrap of protection area

- The outer wrap (black/grey tape) must at least fully cover the first wrap. Position the black/grey tape at one end of the protection area with half of it covering the inner wrap and the grey surface facing the inner wrap, the black side facing outward.
- The tape wrapping shall cover the complete jointing and extend by at least 150 mm beyond the protected joint onto the pipe (protection area).
- Apply one circumferential wrap and continue wrapping it spirally with minimum 50% overlap across the complete protection area.
- Keep the tape under tension to avoid any kinks and creases. A good indicator for sufficient tension is if the tape’s width is narrowed by approximately 1% during application.
- The tape wrapping should cover the complete pipe and extend by at least 150 mm beyond the protected joint (protection area).

![Fig. A1-7 First tape wrapping of complete protection area](image)
![Fig. A1-8 Wrapping the protection area with black/grey tape](image)
![Fig. A1-9 Fully protected joint with corrosion protection system](image)

No wrinkles, creases or kinks are allowed in the finished wrapping on visual testing.
Fig. A2-1 RAUGUARD installation sequence
STEP 1: Select required size

RAUGUARD sizes are matched to the respective RAUTITAN gas stabil pipes to ensure the carrier pipes can be completely protected from one fitting to the next. Use Table A2-1 for selecting the correct RAUGUARD size.

To protect very short sections of RAUTITAN gas stabil 40 x 6.0, a combination of RAUGUARD 40 and 40+ is required. Please refer to next section for details.

<table>

<td>RAUGUARD 40+</td>
</tr>
</tbody>
</table>

Tab. A2-1  Available RAUGUARD sizes

STEP 2: Establish required length

For full protection against vermin, RAUGUARD must cover the RAUTITAN gas stabil pipes completely from fitting collar to fitting collar. If this is not the case, rodent can damage the pipe resulting in a gas leak.

To achieve a complete cover of the pipes, the following must be observed:
- An accurate measurement of the required protection length.
- Before marking the cut length of the RAUGUARD, it must be in a relaxed condition.

The required protection length is the distance from fitting collar to fitting collar, i.e. RAUGUARD must not cover only the pipe itself but also the compression sleeves on each fitting as shown in Figure A2-2.

To determine the required cut length of RAUGUARD, the following needs to be considered:
- Three conditions are possible for RAUGUARD:
  - Relaxed - natural position, the conduit is not under any external forces.
  - Extended - conduit is stretched.
  - Contracted - conduit is compressed.
  The length of RAUGUARD in each of the three conditions differs with its size.
- To complete a REHAU compression sleeve joint, RAUGUARD must be pushed away from the cut pipe end by a minimum of three times the length of the compression sleeve. This will allow an unrestricted expansion process of the pipe. (see Figure A2-3).
RAUGUARD has to be installed in its natural condition, without any external forces applied to it. Each RAUGUARD size can be compressed to a minimum length which varies with its diameter. The minimum installation length of each RAUGUARD size, as listed in Table A2-2, is derived from the fully contracted RAUGUARD together with the three times the length of the respective compression sleeve size.

<table>

<td>40 x 6.0</td>
<td>0.6</td>
</tr>
</tbody>
</table>

Tab. A2-2 Minimum installation lengths based on RAUGUARD and carrier pipe size

As a result of the considerations listed above, there are two possibilities:
- The required protection length is greater than the minimum installation length. In this case, ensure RAUGUARD is in its relaxed condition / natural length and mark the required protection length on the conduit before cutting it.
- The required protection length is shorter than the minimum installation length. This means two different RAUGUARD sizes have to be used. Ensure the respective RAUGUARD is in its relaxed condition and mark two-third of the required protection length and cut it. Select the next larger RAUGUARD size and mark half of the protection length; again, ensure the conduit is in its relaxed condition before cutting the conduit. The larger RAUGUARD slides easily over the smaller making it possible to push it back far enough to complete the REHAU compression sleeve joint.

When marking the cut length on conduit always ensure RAUGUARD is in its natural length.

STEP 3: Cut RAUGUARD

Danger of cutting injuries!
Inappropriate handling of RAUGUARD and cutting tools can result in severe cutting injuries or severed limbs.
- Maintain safe distance between cutting tool and your hand holding the conduit.
- Check for sharp edges and corners when handling RAUGUARD.

RAUGUARD can be separated by gripping it with both hands placed closely together and twisting both hands against each other in the direction indicated in Figure A2-4.

The now exposed single steel band can be easily cut with any commonly available tin snippers or side cutters as shown in Figure A2-5.
**STEP 4: Fit RAUGUARD over carrier pipes**

Never install RAUGUARD with the cut edges facing towards the carrier pipe, as this can damage the pipe resulting in a gas leak. Check RAUGUARD for sharp edges, and if present, remove them before fitting conduit onto pipes.

The installation procedures of the two possible conditions for RAUGUARD during installation, as mentioned in Step 2, are now explained in greater detail.

**STEP 4a: REQUIRED PROTECTION LENGTH IS LONGER THAN MINIMUM INSTALLATION LENGTH**

- Feed RAUGUARD completely onto the carrier pipe making sure the far end fully covers the compression sleeve as shown in Figure A2-6.

- Compress conduit by at least three times the compression sleeve length to expose sufficient carrier pipe for correct expansion.

- Complete the REHAU compression sleeve joint in a normal fashion.

- Pull back RAUGUARD all the way to the fitting, making sure it covers both compression sleeves fully.
STEP 4b: Required protection length is shorter than minimum installation length

- Feed the smaller RAUGUARD completely onto the carrier pipe; make sure the far end fully covers the compression sleeve as shown in Figure A2-10.

Fig. A2-10 Pushing RAUGUARD all the way against the fitting

- Slip a suitable hose clamp (see Figures A2-11 and A2-12) onto the RAUGUARD.

Fig. A2-11 Common hose clamps with worm drive

- Feed the larger RAUGUARD onto the carrier pipe and over the smaller RAUGUARD until sufficient carrier pipe length is exposed (at least three times the compression sleeve length) to ensure a safe pipe expansion (see Figure A2-13).

Fig. A2-12 Hose clamp over RAUGUARD

- Complete the REHAU compression sleeve joint in a normal fashion.

Fig. A2-13 Second joint completed - Larger RAUGUARD pushed back over smaller RAUGUARD
- Push both conduits against the fittings and lock into place with the hose clamping, making sure both conduits fully cover the compression sleeves at each end.

**STEP 5: Protect vertical pipe runs with RAUGUARD**

When installed vertically, due to gravity, an unrestrained RAUGUARD will always sit in its compressed position. In such cases, RAUGUARD has to be clipped in place to ensure it also covers the upper pipe end and the fitting.

RAUGUARD 16/20 can also be secured against slipping down with REHAU pipe bend brackets size 32, if the pipe-run continues horizontally from the top as depicted in Figure A2-16.

---

**For horizontal runs, RAUGUARD does not have to be fitted in one continuous length cut offs from previous sections can be used and simply be taped together where both ends meet.**
If it is not possible to fix RAUGUARD into position, the application of RAUGUARD follows the procedure given in the previous chapter for protecting pipe runs shorter than the minimum installation length of RAUGUARD.

The hose clamp locks both conduits into position making it possible to fully protect the fitting at the top and the upper part of the pipe as shown in Figure A2-17.

**STEP 6: Clip RAUGUARD**

Common electrical conduit brackets can be used to clip RAUGUARD as shown in Figure A2-18. The spacing of clips is according to the guidelines in Section: Pipe support and fixing.
## APPENDIX A3

### PRESSURE DROP TABLES RAUTITAN GAS STABIL (NATURAL GAS)

**Natural Gas (NG)**

Flow rates based on:
- Pressure: 1023.15 mbar
- Gas temperature: 15°C
- Heating value (gross): 38.7 MJ/m³

**Pressure drop of 0.075 kPa**

(Supply pressure of around 1.1 kPa)
