

## REHAU CABLE MANAGEMENT SYSTEMS

LITHERLAND HIGH SCHOOL, LIVERPOOL

# REHAU PROFILA BENCH TRUNKING

## EASE OF INSTALLATION

REHAU's new PROFILA Bench cable management system has been installed alongside its standard data cable management systems in the newly opened Litherland High School in Liverpool to accommodate Cat 6a, power and AV cabling.

The trunking was installed by NG Bailey, after the building services provider had been impressed by the quality and ease of fixing of the REHAU PROFILA system in a previous project at Burnley College in 2010.

This is one of the first installations of REHAU's new Bench trunking system which uses a triangular shaped PVC base profile and single lid for the safe and discreet distribution of data cabling on top of work surfaces.

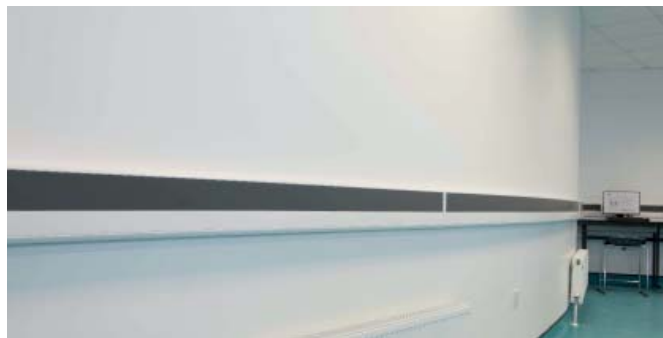

A single base component can be configured either 'high' to maximise the useful worktop area or 'low' to fit where vertical space is limited, for example beneath a window; and the system can even be used back to back across the middle of worktops in laboratories or as columns, pods or pillars. Manufactured using a high impact resistant PVC, the Bench trunking

incorporates a unique ribbed base and walls to ensure that the trunking is neatly raised away from any spillages of dangerous materials.

Both the PROFILA Bench and Data trunking systems at Litherland High School were supplied by REHAU with grey lids where appropriate to meet the requirements of Part M of the Building Regulations governing use by the visually impaired.

NG Bailey was also able to accommodate the gently curving lines of some of the internal walls at the school by using the inherent flexibility of straight sections and fixing to the wall with additional fixings. For curves with a tighter radius, REHAU can supply bespoke preformed curved sections.

The new PROFILA Bench trunking system was developed specifically to meet the demands of the education and health sectors where REHAU is one of the leading cable management suppliers. It is a practical and cost effective solution to accommodating worktops and can be jointed to the standard PROFILA data trunking using a simple adaptor giving a coherent overall look.
